1. Features

- **16Mbit SPI NOR Flash**
 - Totally 2M bytes
 - 256-byte Page Program
 - 0.5KB/4KB Sector/32KB Block/64KB Block/Chip Erase
- **Protocols Supported**
 - Standard SPI: SCLK, CS#, SI, SO, WP#, HOLD#
 - Dual SPI: SCLK, CS#, IO0, IO1, WP#, HOLD#
 - Quad SPI: SCLK, CS#, IO0, IO1, IO2, IO3
- **Single Supply Voltage**
 - Full voltage range: 1.65V~3.6V
- **High Performance**
 - 120MHz maximum clock frequency
 - Dual I/O data throughput up to 208Mbit/s
 - Quad I/O data throughput up to 480Mbit/s
 - Page Program: 0.7ms typical
 - 1KB Sector Erase: 6ms typical
 - Sector Erase: 6ms typical
 - 32KB Block Erase: 6ms typical
 - 64KB Block Erase: 6ms typical
 - Chip Erase: 7ms typical
- **Software and Hardware Write Protection**
 - Protection of portion or all of memory space
 - Protection enabled/disabled by WP#
 - Top/Bottom protection mechanisms
- **Low Power Consumption**
 - 10uA Standby current
 - Maximum 20mA active current
 - Typical 1uA power down current
- **Advanced Security Features**
 - 3*1024-byte Security Registers with OTP lock
 - 128-bit Unique ID for each device
- **Temperature Range**
 - Commercial: -20°C to +85°C
 - Industrial: -40°C to +85°C
- **Endurance of 100,000 Program/Erase Cycles**
- **Data Retention of 20 Years**
- **Industry Standard Packaging**
 - SOP8, SOP16
 - DIP8
 - WSON8
 - TFBGA-24

2. General Description

The SP25WQ16A is a 16Mbit Serial Peripheral Interface (SPI) NOR Flash memory device which supports standard SPI, Dual SPI and Quad SPI modes with user pins being SCLK, CS#, SI, SO, WP# and HOLD#, and the latter four of them may also function as IO0, IO1, IO2 and IO3.

The main array of the device can be viewed as a 2M-byte array of data bytes, which can be erased at a variety of granularities, programmed or written in a maximum of 256-byte pages and read for any volumes of bytes.

Additionally, the device supports JEDEC standard manufacturer and device ID and SFDP Register, a 128-bit Unique Serial Number and three 1024-Bytes Security Registers. The SP25WQ16A provides an ideal storage solution for systems with limited space, signal connections, and power. These memories' flexibility and performance is better than ordinary serial flash devices. They are ideal for code shadowing to RAM, executing code directly (XIP), and storing reprogrammable data.

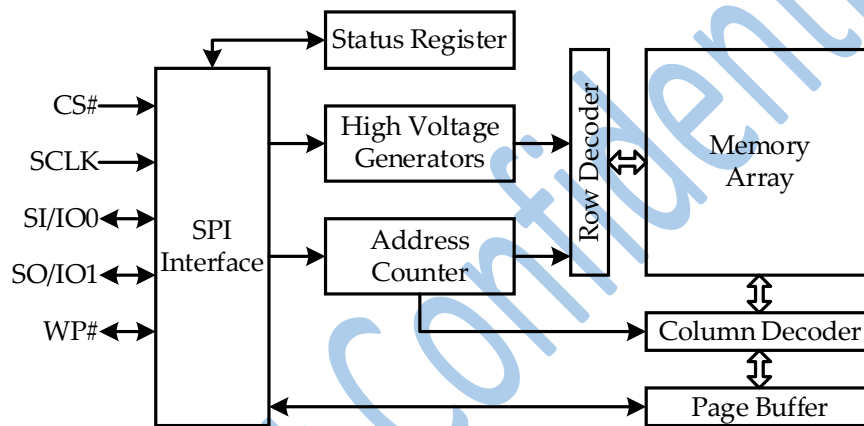

Figure 1: SP25WQ16A SPI Flash Block Diagram

3. Pin Configuration

The SP25WQ16A device has the following pin configurations.

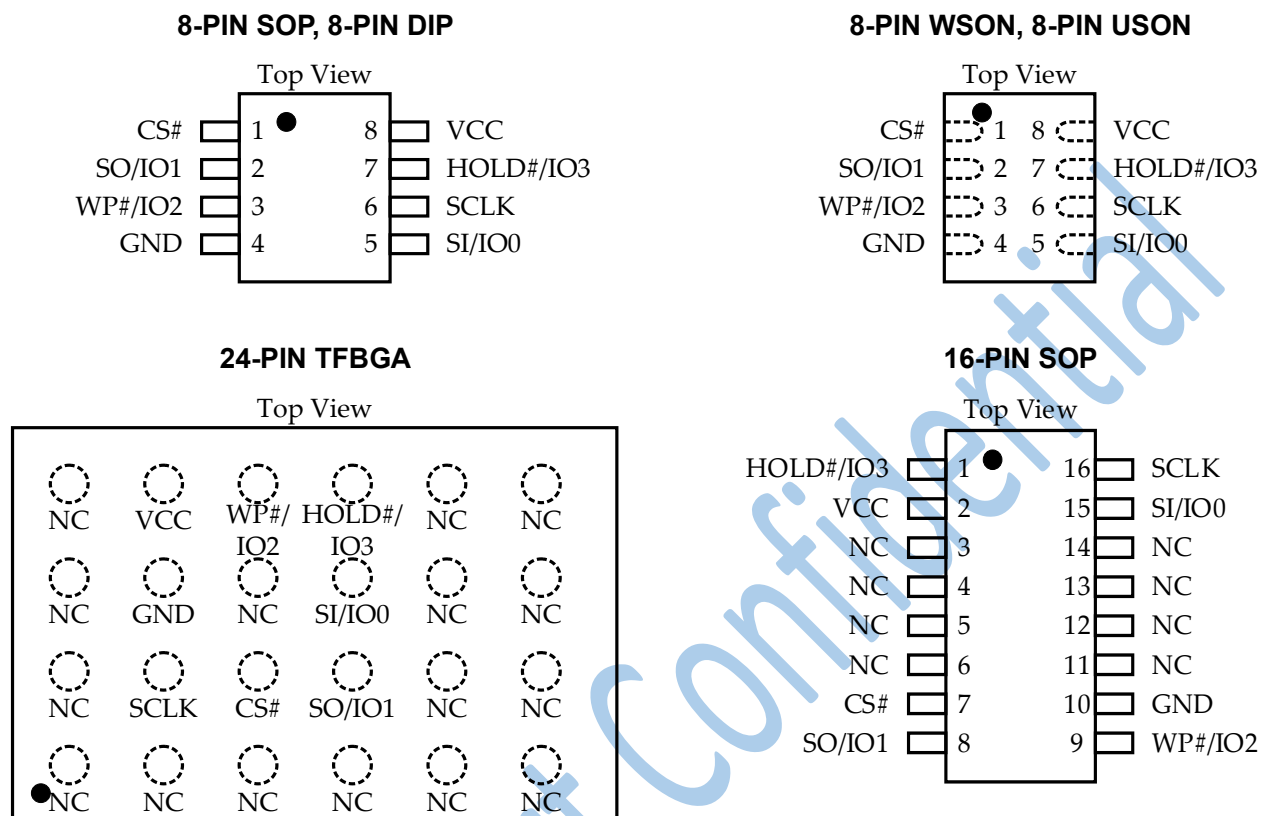

Figure 2: Pin Map

4. Pin Description

The SP25WQ16A SPI Flash memory device operates with a wide supply range from 1.65V to 3.6V.

Table 1: Pin Definitions

Signal	Direction	Description
CS#	Input	Chip Select, active low
SCLK	Input	Clock Input
SI/IO0	Input/Output	Serial Data Input in standard SPI; IO0 in Dual and Quad SPI
SO/IO1	Input/Output	Serial Data Output in standard SPI; IO1 in Dual and Quad SPI
WP#/IO2	Input/Output	Active low Write Protect in standard SPI; IO2 in Quad SPI
HOLD#/IO3	Input/Output	Active low Hold Input in standard SPI; IO3 in Quad SPI
VCC	-	Power Supply
GND	-	GND

4.1. Chip Select (CS#)

The Chip Select (CS#) pin enables and disables device operations.

When CS# is high, the device is deselected and all data output pins are at high impedance state; the device is in standby mode with standby level of power consumption if Write Status Register, program or erase operations are absent.

When CS# is low, the device is selected, available for incoming commands.

4.2. Clock Input (SCLK)

The clock input provides a reference of the synchronization of the SPI interface. All inputs are latched on the rising edge of SCLK, while all data shifts out on its falling edge.

4.3. Serial Input (SI/IO0)

Serial input is a unidirectional pin in Standard SPI mode, which is the input for all commands, data and address. In Dual SPI modes, SI functions as bidirectional IO0, which receives command, address and data as an input, and shifts out data as an output.

4.4. Serial Output (SO/IO1)

SO is unidirectional in Standard SPI mode for the output of all internal status and data. In Dual SPI modes, SO functions as bidirectional IO1, which receives data and address, and shifts out data.

4.5. Write Protect (WP#/IO2)

The WP# Write Protect function is available only if QE is 0. The WP# pin in conjunction with SRP0 bit protect the Status Register from unwanted modifications.

When QE is 1, Quad SPI mode is enabled, and if Quad SPI command is issued, then the WP# function is disabled and this pin functions as a dedicated IO2 data pin, which receives address and data, and also shifts out data.

4.6. HOLD (HOLD#/IO3)

The HOLD# function is available only if QE is 0. Driving the HOLD# pin low halts all serial communications of the device, without affecting any ongoing WRSR, program or erase operations in progress. During hold state, all outputs are released to high impedance, and SI and SCLK are ignored by the device. Deasserting CS# while HOLD# is low will reset the internal logic of the device.

SCLK and HOLD# controls the entrance and exit of hold state. A falling edge of HOLD# during SCLK=0, or falling edge of SCLK during HOLD#=0 brings the device into HOLD state; a rising edge of HOLD# while SCLK=0, or falling edge of SCLK while HOLD#=1 brings the device out of HOLD state. The CS# should keep low during HOLD state.

Figure 3: HOLD Condition

When QE is 1, Quad SPI is enabled, and if Quad SPI command is issued, then the HOLD# function is disabled and this pin functions as dedicated IO3 data pin, which receives data and address, and shifts out data.

While the device is in Quad SPI mode, tying the HOLD# pin directly to Vcc or GND is strictly forbidden to avoid signal conflict which may lead to permanent damage in the device.

5. Memory Organization and Operations

The SP25WQ16A utilizes a variety of registers and memory array to store control information and user data, including: Identification, Status Register, Security Register, SFDP register, main memory array.

5.1. Identification

Table 2: Identification Definitions

Command	Comments	Manufacture ID (MID7 ~ MID0)	Memory Type (ID15 ~ ID8)	Memory Density (ID7 ~ ID0)	Device ID (ID7 ~ ID0)
----	----	94h	40h	15h	14h
9Fh	Read Identification	√	√	√	----
90h/92h/94h	Read Manufacturer / Device ID	√	----	----	√
ABh	Read Device ID	----	----	----	√

5.2. Status Register

The Read and Write Status Registers commands can be used to provide status and control of the flash memory device. Status Register-1 (SR1) and Status Register-2 (SR2) can be used to provide status on the availability of the flash memory array, whether the device is write enabled or disabled, the state of write protection, Security Register lock status.

Table 3: Status Register 3 (SR3)

Bit	S23	S22	S21	S20	S19	S18	S17	S16
Name	Reserved	DRV1	DRV0	Reserved	Reserved	Reserved	Reserved	Reserved
R/W	----	R/W	R/W	----	----	----	----	----

Abbreviations used in (1)The SR2 register is read by 35h and written by 31h commands.

(2)The default of SR2 is 8'h0;

Table 5 through Table 7:

(1) R/W: the bit can be read or written;

(2) R: the bit is read only ;

(3) The default of SR3 is 8'h40;

The SR3 register is read by 15h and written by 11h commands.

Table 4: Status Register 2 (SR2)

Bit	S15	S14	S13	S12	S11	S10	S9	S8
Name	SUS1	CMP	LB3	LB2	LB1	SUS2	QE	SRP1
R/W	R	R/W	R/W	R/W	R/W	R	R/W	R/W

- (1)The SR2 register is read by 35h and written by 31h commands.
(2)The default of SR2 is 8'h0;

Table 5: Status Register 1 (SR1)

Bit	S7	S6	S5	S4	S3	S2	S1	S0
Name	SRP0	BP4	BP3	BP2	BP1	BP0	WEL	WIP
R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R

- (1)The SR1 register is read by 05h and written by 01h commands.
(2)The default of SR1 is 8'h0;

5.2.1. WIP Bit

Write In Progress Bit(WIP) indicates whether a WRSR, program or erase operation is in progress.

0 = device is idle

1 = device is busy in WRSR, program or erase operation

5.2.2. WEL Bit

Write Enable Latch Bit(WEL) indicates whether the device is ready to accept a WRSR, program or erase command.

0 = WRSR, program or erase command is not accepted

1 = WRSR, program or erase command is allowed

WEL is reset by:

- (1) Power up;
- (3) Write Disable (WRDI, 04h) command;
- (2) Completion of WRSR, program or erase operations;
- (4) Software Reset (66h+99h) command.

5.2.3. BP4, BP3, BP2, BP1, BP0 Bits

BP4 through BP0 are Block Protect bits. BP bits in combination with CMP bit define the protect scheme of the main memory array.

For details, see Table 13 and Table 14.

5.2.4. The Status Register Protect (SRP1, SRP0)

The Status Register Protect bits (SRP1 and SRP0) are non-volatile read / write bits in the Status Register (SR2[0] and SR1[7]). The SRP bits control the method of write protection: software protection, hardware protection, power supply lock-down, or one time programmable (OTP) protect .For details, see Table12.

5.2.5. QE Bit

QE Bit indicates whether the quad mode is enabled. When QE is 0, WP# and HOLD# pins are enabled. When QE is 1, Quad SPI operations enabled and WP#, HOLD# functions as IO2, IO3.

If WP# or HOLD# is tied directly to power supply or GND, then the QE bit should never be set to 1 to avoid signal conflict. The default value is 1'b0;

5.2.6. SUS2, SUS1 Bits

SUS2: Program Suspend Bit indicates whether a Program operation is in suspension. The bit is set to 1 by 75h command, cleared to 0 by 7Ah or 66h+99h commands, or powering up the device. The default value is 2'h0;

0 = The device is not in Program suspension.

1 = Program suspension in progress.

SUS1: The Erase Suspend Bit indicates whether an Erase operation is in suspension. The bit is set to 1 by 75h command, cleared to 0 by 7Ah or 66h+99h commands, or powering up the device.

0 = The device is not in Erase suspension.

1 = Erase suspension in progress.

5.2.7. LB3, LB2, LB1 Bits

LB3, LB2 and LB1 are the Lock Bits for Security Registers 3, 2 and 1, respectively.

0 = The corresponding Security Register can be programmed/erased.

1 = The corresponding Security Register is protected permanently.

LB3 through LB1 are OTP bits. Upon device delivery, they are default to 0. Programming from 0 to 1 is permanent. LB3, LB2 and LB1 are can only be written by 06h command, but not can be written by 50h command.

5.2.8. CMP Bit

Complement Protect Bit(CMP), which in conjunction with Block Protect bits (BP4 through BP0) determines the protection scheme of the main memory array.

For details, see Table 13 and Table 14.

5.2.9. DRV1, DRV0 Bits

DRV1 and DRV0 Bits control the drive strength which to determine the drive strength of output buffers in read operations. The default value is 2'b10.

DRV1, DRV0 = 00: 100%

DRV1, DRV0 = 01: 75%

DRV1, DRV0 = 10: 50% (default)

DRV1, DRV0 = 11: 25%

5.3. Security Register

Security Registers are three 512-byte registers that can be individually protected by OTP programmable LB bits. Once a LB bit is set to 1, the corresponding Security Register becomes permanently locked and all program or erase operations are ignored.

These registers can be individually erased, programmed or read using 44h, 42h or 48h commands; they may be used as storage for security or other important information separately from the main memory array.

Table 6: Security Register Address Distribution

Security Register	A23-A16	A15-A12	A11-A9	A8-A0
Security Register #1	00h	0001	0	Byte Address

Security Register #2	00h	0010	0	Byte Address
Security Register #3	00h	0011	0	Byte Address

5.4. SFDP Register

The SP25WQ16A features a 256-byte Serial Flash Discoverable Parameter (SFDP) register. It provides a means to interrogate flash device characteristics and make appropriate adjustments while accessing the device.

The concept of SFDP Register definitions is similar to the JEDEC JESD216 standard (April 2011).

5.4.1. SFDP Header Information

Table 7: Signature and Parameter Identification Data Values

Description	Comment	Addr ¹	Bits ²	Data ³	Data ⁴
SFDP Signature	Fixed:50444653h	00h	[07:00]	53h	53h
		01h	[15:08]	46h	46h
		02h	[23:16]	44h	44h
		03h	[31:24]	50h	50h
SFDP Minor Revision Number	Start from 00h	04h	[07:00]	00h	00h
SFDP Major Revision Number	Start from 01h	05h	[15:08]	01h	01h
Number of Parameters Headers	Start from 00h	06h	[23:16]	01h	01h
Unused	Contains 0xFFh and can never be changed	07h	[31:24]	FFh	FFh
ID number (JEDEC)	00h: A JEDEC specified header	08h	[07:00]	00h	00h
Parameter Table Minor Revision Number	Start from 0x00h	09h	[15:08]	00h	00h
Parameter Table Major Revision Number	Start from 0x01h	0Ah	[23:16]	01h	01h
Parameter Table Length (in double word)	Number of DWORDs in the Parameter table	0Bh	[31:24]	09h	09h
Parameter Table Pointer (PTP)	First address of JEDEC Flash Parameter table	0Ch	[07:00]	30h	30h
		0Dh	[15:08]	00h	00h
		0Eh	[23:16]	00h	00h
Unused	Contains 0xFFh and can never be changed.	0Fh	[31:24]	FFh	FFh
ID Number (SEMIPORT Manufacturer ID)	Indicates SEMIPORT manufacturer ID	10h	[07:00]	94h	94h
Parameter Table Minor Revision Number	Start from 0x00h	11h	[15:08]	00h	00h
Parameter Table Major Revision Number	Start from 0x01h	12h	[23:16]	01h	01h
Parameter Table Length (in double word)	Number of DWORDs in the Parameter table	13h	[31:24]	03h	03h
Parameter Table Pointer (PTP)	First address of SEMIPORT Flash Parameter table	14h	[07:00]	60h	60h
		15h	[15:08]	00h	00h
		16h	[23:16]	00h	00h

Unused	Contains 0xFFh and can never be changed	17h	[31:24]	FFh	FFh
--------	---	-----	---------	-----	-----

5.4.2. Parameter Table (0)

Table 8: Parameter Table (0): JEDEC Flash Parameter Tables

Description	Comment	Addr	Bits	Data	Data
Block/Sector Erase Size	00: Reserved; 01: 4KB Erase; 10: Reserved; 11: do not support 4KB erase	30h	[01:00]	01b	E5h
Write Granularity	0: 1Byte, 1: 64Byte or larger		[02]	1b	
Write Enable Instruction Required for Writing to Volatile Status Register	0: Nonvolatile status bit 1: Volatile status bit		[03]	0b	
Write Enable Opcode Select for Writing to Volatile Status Registers	0: Use 50h Opcode; 1: Use 06h Opcode. Note: If target flash status register is Nonvolatile, then bits 3 and 4 must be set to 00b.		[04]	0b	
Unused	Contains 111b and can never be changed		[07:05]	111b	
4KB Erase Opcode		31h	[15:08]	20h	20h
(1-1-2) Fast Read	0=Not supported 1=Supported	32h	[16]	1b	F1h
Number of Address Bytes used in addressing flash array	00: 3-Byte only; 01: 3- or 4-Byte; 10: 4-Byte only; 11: Reserved		[18:17]	00b	
Double Transfer Rate (DTR) clocking	0=Not supported 1=Supported		[19]	0b	
(1-2-2) Fast Read	0=Not supported 1=Supported		[20]	1b

Block0	15	00F000H	00FFFFFFH

	0	000000H	000FFFFH

6. SPI Operation

6.1. Standard SPI

Standard SPI has a four signal bus: CS#, SCLK, SI and SO. Both mode 0 and 3 are supported. Input data is latched on the rising edge of SCLK and data shifts out on the falling edge of SCLK.

6.2. Dual SPI

The device supports Dual SPI operations for the following commands:

"Dual Output Fast Read" (3Bh);

"Dual I/O Fast Read" (BBh);

"Dual Input Page Program (A2h)"

"Read Manufacture ID / Device ID Dual I/O" (92h).

During these commands, SI and SO pins become IO0 and IO1. Data is transferred using IO0 and IO1, doubling the throughput of Standard SPI mode.

7. Data Protection

As a nonvolatile memory device the SP25WQ16A may suffer from the compromise of data integrity in the event of noise and other adverse system conditions. To improve the robustness of the device, certain methods are adopted to protect the data from inadvertent WRSR, program or erase operations.

7.1. Write Protect Features

SP25WQ16A offers the following protection schemes.

- (1) The device is reset when Vcc is below threshold.
- (2) Write is disabled for a duration after device is power-up.
- (3) Prior to WRSR, program or erase operations, a Write Enable (WREN) command is needed to set WEL bit to 1; after these operations are complete, the WEL bit returns to 0.

This mechanism ensures that the memory content can be changed only after specific command sequence is successfully completed.

- (4) Software Protection Mode: The CMP, BP4, BP3, BP2, BP1 and BP0 bits define the address space in the main memory array that is under protection. The protected area can only be read out; program or erase operations to protected area are ignored.

For details, see Table 13 and Table 14.

- (5) Hardware Protection Mode: WP# pin and SRP0,SRP1 bit protect Status Register bits from modifications.

For details, see Table 12.

- (6) While in Deep Power-Down Mode, the device ignores all commands except Release from Deep Power-Down

Mode (ABh). This protects the device from all WRSR, program or erase commands.

7.2. Status Register Protection

SRP0 and SRP1 bit in the Status Register and WP# pin provide protection for the Status Register itself.

Table 12: Status Register Protection Scheme

SRP1	SRP0	WP#	Protection Scheme	Description
0	0	X	Software Protected	WP# pin has no control. SR1 and SR2 can be written to after a Write Enable command, WEL=1.
0	1	0	Hardware Protected	When WP# pin is low the SR1 and SR2 are locked and cannot be written.
0	1	1	Hardware Unprotected	When WP# pin is high SR1 and SR2 are unlocked and can be written to after a Write Enable command, WEL=1.
1	0	X	Power Supply Lock Down	SR1 and SR2 are protected and cannot be written to again until the next power-down, power-up cycle.
1	1	X	One Time Program	SR1 and SR2 are permanently protected and can't be written.

Notes:

(1) When SRP1, SRP0 = (1, 0), a power-down, power-up, or Software Reset cycle will change SRP1, SRP0 to (0, 0) state.

7.3. Main Memory Array Protection

A combination of Status Register bits define the area space of the memory array that is protected from program and erase operations. A program operation targeted at a page address that is under protection is not executed. For erase operations, if any address location within the designated target area is protected then the command is not executed.

7.3.1. CMP=0

Table 13: SP25WQ16A Memory Protection pattern (CMP=0)

Status Register					Block Protection (CMP=0)			
BP4	BP3	BP2	BP1	BP0	Blocks	Address Range	Density	Portion
x	x	0	0	0	None	None	None	None
0	0	0	0	1	31	1F0000h – 1FFFFFFh	64KB	Upper 1/32
0	0	0	1	0	30 thru 31	1E0000h – 1FFFFFFh	128KB	Upper 1/16
0	0	0	1	1	28 thru 31	1C0000h – 1FFFFFFh	256KB	Upper 1/8
0	0	1	0	0	24 thru 31	180000h – 1FFFFFFh	512KB	Upper 1/4
0	0	1	0	1	16 thru 31	100000h – 1FFFFFFh	1MB	Upper 1/2
0	1	0	0	1	0	000000h – 00FFFFh	64KB	Lower 1/32

0	1	0	1	0	0 thru 1	000000h – 01FFFFh	128KB	Lower 1/16
0	1	0	1	1	0 thru 3	000000h – 03FFFFh	256KB	Lower 1/8
0	1	1	0	0	0 thru 7	000000h – 07FFFFh	512KB	Lower 1/4
0	1	1	0	1	0 thru 15	000000h – 0FFFFFFh	1MB	Lower 1/2
x	x	1	1	x	0 thru 31	000000h – 1FFFFFFh	2MB	ALL
1	0	0	0	1	31	1FF000h – 1FFFFFFh	4KB	Upper 1/512
1	0	0	1	0	31	1FE000h – 1FFFFFFh	8KB	Upper 1/256
1	0	0	1	1	31	1FC000h – 1FFFFFFh	16KB	Upper 1/128
1	0	1	0	x	31	1F8000h – 1FFFFFFh	32KB	Upper 1/64
1	1	0	0	1	0	000000h – 000FFFh	4KB	Lower 1/512
1	1	0	1	0	0	000000h – 001FFFh	8KB	Lower 1/256
1	1	0	1	1	0	000000h – 003FFFh	16KB	Lower 1/128
1	1	1	0	x	0	000000h – 007FFFh	32KB	Lower 1/64

Notes:

- (1) X = don't care
- (2) If any Erase or Program command specifies a memory region that contains protected data portion, this command will be ignored.

7.3.2. CMP=1

The CMP bit offers more flexibility in memory protection, as is shown below.

Table 14: SP25WQ16A Memory Protection pattern (CMP=1)

Status Register					Block Protection (CMP=1)			
BP4	BP3	BP2	BP1	BP0	Blocks	Address Range	Density	Portion
x	x	0	0	0	0 thru 31	000000h – 1FFFFFFh	2MB	ALL
0	0	0	0	1	0 thru 30	000000h – 1EFFFFh	1984KB	Lower 31/32
0	0	0	1	0	0 thru 29	000000h – 1DFFFFh	1920KB	Lower 15/16
0	0	0	1	1	0 thru 27	000000h – 1BFFFFh	1792KB	Lower 7/8
0	0	1	0	0	0 thru 23	000000h – 17FFFFh	1536KB	Lower 3/4
0	0	1	0	1	0 thru 15	000000h – 0FFFFFFh	1MB	Lower 1/2
0	1	0	0	1	1 thru 31	010000h – 1FFFFFFh	1984KB	Upper 31/32
0	1	0	1	0	2 thru 31	020000h – 1FFFFFFh	1920KB	Upper 15/16
0	1	0	1	1	4 thru 31	040000h – 1FFFFFFh	1792KB	Upper 7/8
0	1	1	0	0	8 thru 31	080000h – 1FFFFFFh	1536KB	Upper 3/4
0	1	1	0	1	16 thru 31	100000h – 1FFFFFFh	1MB	Upper 1/2
x	x	1	1	x	NONE	NONE	NONE	NONE
1	0	0	0	1	0 thru 31	000000h – 1FEFFFh	2044KB	Lower 511/512
1	0	0	1	0	0 thru 31	000000h – 1FDFFFh	2040KB	Lower 255/256
1	0	0	1	1	0 thru 31	000000h – 1FBFFFh	2032KB	Lower 127/128

1	0	1	0	x	0 thru 31	000000h – 1F7FFFh	2016KB	Lower 63/64
1	1	0	0	1	0 thru 31	001000h – 1FFFFFh	2044KB	Upper 511/512
1	1	0	1	0	0 thru 31	002000h – 1FFFFFh	2040KB	Upper 255/256
1	1	0	1	1	0 thru 31	004000h – 1FFFFFh	2032KB	Upper 127/128
1	1	1	0	x	0 thru 31	008000h – 1FFFFFh	2016KB	Upper 63/64

Notes:

- (1) X = don't care
- (2) If any Erase or Program command specifies a memory region that contains protected data portion, this command will be ignored.

8. Command Definitions

All commands, addresses and data are shifted in and out of the device, beginning with the MSB of the command opcode. All inputs are latched into the device on SCLK rising edge, while all outputs are shifted out on SCLK falling edge.

Every command sequence starts with a one-byte command code. Depending on the command, the command code might be followed by address bytes, data bytes, dummy bytes, or a combination. CS# must be driven high after the last bit of the command sequence is completed.

Read-related commands (Read, Fast Read, Read Status Register or Release from Deep Power-Down, Read Device ID) shifts out data from the device. CS# can be driven high after any bit of the output data sequence.

For other commands including Page Program, Sector Erase, Block Erase, Chip Erase, Write Status Register, Write Enable, Write Disable or Deep Power-Down, CS# must be driven high exactly at a byte boundary; otherwise if CS# is driven high at any time when the input byte is not a full byte, the command is ignored and WEL will not be reset.

Table 15: Command Definitions (Standard SPI, Dual SPI)

Command	Byte 1	Byte 2	Byte 3	Byte 4	Byte 5	Byte 6	n-Bytes
Enable Reset	66h						
Reset	99h						
Read Unique ID	4Bh	dummy	dummy	dummy	dummy	UID63-UID0	(continuous)

Quad I/O Fast Read	EBh	A23-A0, M7-M0	dummy	D7-D0	(Next byte)	(Next byte)	(continuous)
Quad I/O Word Fast Read	E7h	A23-A0, M7-M0	dummy	D7-D0	(Next byte)	(Next byte)	(continuous)
Volatile SR Write Enable	50h						
Read Status Register-1	05h	S7-S0					(continuous)
Read Status Register-2	35h	S15-S8					(continuous)
Read Status Register-3	15h	S23-S16					(continuous)
Write Status Register-1	01h	S7-S0					
Write Status Register-2	31h	S15-S8					
Write Status Register-3	11h	S23-S16					
Erase Security Registers	44h	A23-A16	A15-A8	A7-A0			
Program Security Registers	42h	A23-A16	A15-A8	A7-A0	D7-D0	D7-D0	(continuous)
Read Security Registers	48h	A23-A16	A15-A8	A7-A0	dummy	D7-D0	(continuous)
Set Burst with Wrap	77h	dummy, W7-W0					
Program/Erase Suspend	75h						
Program/Erase Resume	7Ah						
Read Serial Flash Discoverable Parameter	5Ah	A23-A16	A15-A8	A7-A0	dummy	D7-D0	(continuous)
Sector Erase(1KB)	8Ah	A23-A16	A15-A8	A7-A0			
Sector Erase(4KB)	20h	A23-A16	A15-A8	A7-A0			

Block Erase (32KB)	52h	A23-A16	A15-A8	A7-A0			
Block Erase (64KB)	D8h	A23-A16	A15-A8	A7-A0			
Chip Erase	C7h/ 60h						
Page Program	02h	A23-A16	A15-A8	A7-A0	D7-D0	(Next byte)	(continuous)
Dual Input Page Program	A2h	A23-A16	A15-A8	A7-A0	D7-D0		
Quad Page Program	32h	A23-A16	A15-A8	A7-A0	D7-D0	(Next byte)	(continuous)
Fast Page Program	F2h	A23-A16	A15-A8	A7-A0	D7-D0	(Next byte)	(continuous)
Release From Deep Power-Down and Read Device ID	ABh	dummy	dummy	dummy	(DID7- DID0)		(continuous)
Release From Deep Power-Down	ABh						
Deep Power-Down	B9h						

Note:

(1) The 01h command could continuously write up to two Bytes to registers SR1, SR2.

8.1. Write Enable (WREN) (06h)

The Write Enable instruction sets the Write Enable Latch (WEL) bit in the Status Register to a 1. The WEL bit must be set prior to every Page Program, 0.5K Sector Erase(SE05K), Sector Erase, Block Erase, Chip Erase and Write Status Register instruction. The Write Enable instruction is entered by driving CS# low, shifting the instruction code “06h” into the Data Input (DI) pin on the rising edge of CLK, and then driving CS# high.

Command sequence:

CS# goes low --> Send 06h command into SI pin --> CS# goes high.

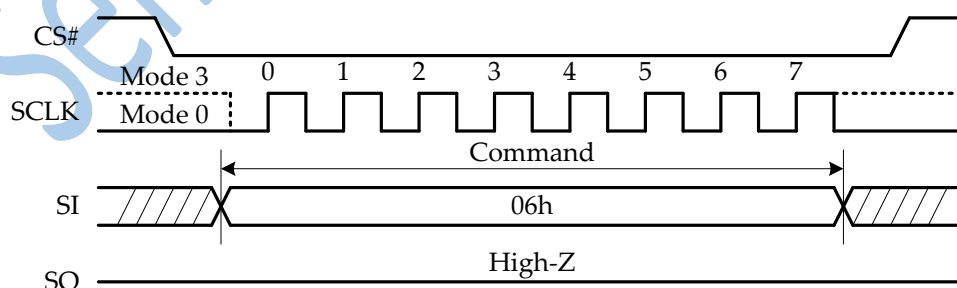

Figure 4: Write Enable (WREN) (06h) Command Sequence

8.2. Write Disable (WRDI) (04h)

The WRDI command resets the WEL bit to 0. The WEL bit is reset by the following operations:

Power-up, WRDI command (04h), Completion of Write Status Register, Completion of Page Program (02h), Quad Page Program (32h), Fast Page Program (F2h), Completion of 1K Sector Erase (8Ah), 4K Sector Erase (20h), 32KB Block Erase (52h), 64KB Block Erase(D8h), Chip Erase (60h, C7h), Completion of Program Security Register (44h), Erase Security Register(42h), Reset command (66h+99h)

Command Sequence:

Drive CS# low --> Send 04h command into SI pin --> Drive CS# high.

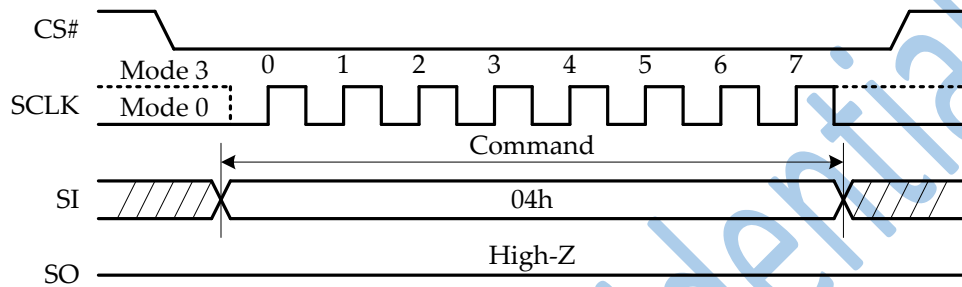

Figure 5: Write Disable (WRDI) (04h) Command Sequence

8.3. Write Enable for Volatile Status Register (50h)

The nonvolatile bits in the Status Register can also be written as volatile bits. This enables the host to quickly change the Status Register bits without the lengthy write cycle of nonvolatile bits, and it does not affect the endurance of the nonvolatile bits in the Status Register.

The 50h command does not set the WEL bit. It must be issued prior to WRSR command (01h, 31h, 11h); there should be no other commands inserted between 50h and WRSR command.

Command sequence:

Drive CS# low --> Send 50h command into SI pin --> Drive CS# high.

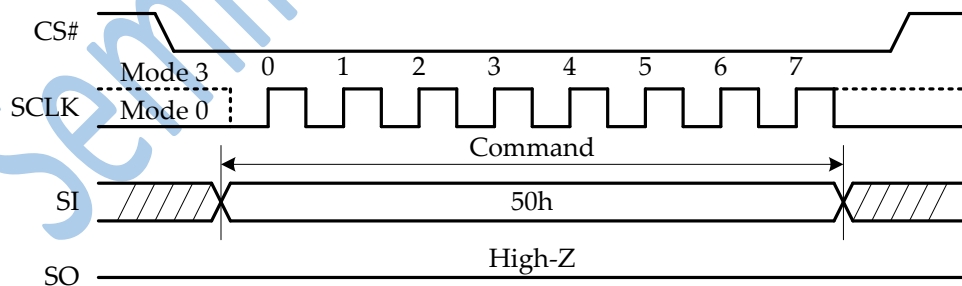

Figure 6: Write Enable for Volatile Status Register (50h) Command Sequence

8.4. Read Status Register (RDSR) (05h or 35h or 15h)

The RDSR commands enables the host to read out the Status Register. This command can be issued anytime, even while a WRSR, program or erase operation is in progress. It is recommended to use RDSR command to check

the WIP bit before the next command is issued to the device.

The commands 05h, 35h and 15h reads SR1 (S7~S0), SR2 (S15~S8) and SR3 (S23~S16), respectively. While CS# remains low, an RDSR command can output the designated Status Register continuously.

Command sequence:

Drive CS# low --> Send RDSR command into SI pin --> Receive output data on SO pin --> Drive CS# high.

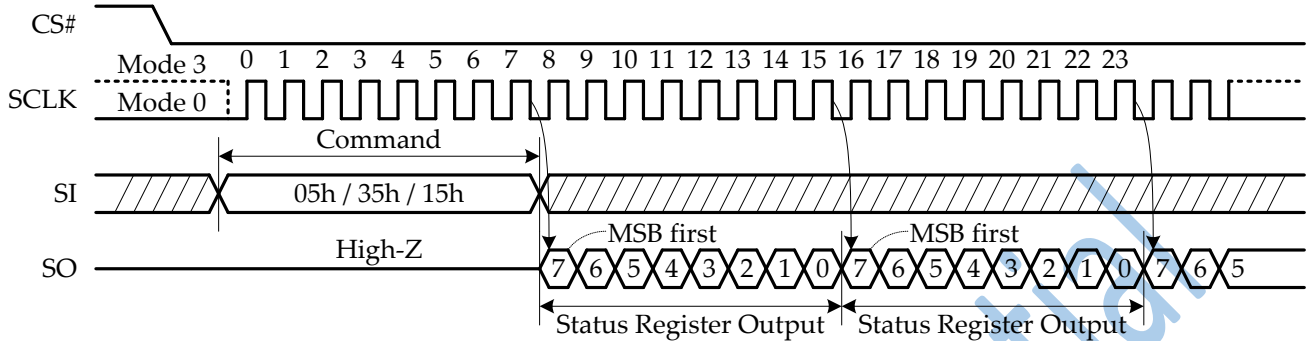

Figure 7: Read Status Register (RDSR) (05h or 35h or 15h) Command Sequence

8.5. Write Status Register (WRSR) (01h or 31h or 11h)

The WRSR command changes the values of Status Register. Before issuing WRSR command, a WREN command is needed to set the WEL bit.

The commands 01h, 31h and 11h writes SR1 (S7~S0), SR2 (S15~S8) and SR3 (S23~S16), respectively.

Within the Status Register, read-only and reserved bits are not affected by WRSR command. Also, following the rules specified in

, a combinations of SRP0 bit and WP# pin may protect the Status Register against any write operations.

For the WRSR command to take effect, CS# must be driven low for the entire duration of the sequence, otherwise the command is ignored. After CS# is driven high, a duration of t_w is required before self-timed write cycle is complete. During t_w , the host may read the Status Register to check WIP bit. WIP is 1 if the device is busy in the write cycle; when the process completes and the device is ready to accept new commands, WIP and WEL are both reset to 0.

Command sequence:

Drive CS# low --> Send WRSR command into SI pin --> Send write data into SI pin --> Drive CS# high.

Figure 8: Write Status Register (WRSR) (01h or 31h or 11h) Command Sequence

8.6. Read Data Bytes (READ) (03h)

The READ command requires a 3-byte address (A23~A0) following the 03h command; the address can point to any location in the main memory array. Command and address are latched in on SCLK rising edge, and output data shifts out on SCLK falling edge. After each byte is shifted out, the address automatically increments to the next byte location; therefore, the entire memory can be output with a single READ command.

Maximum SCLK frequency of READ command is f_r . The command is rejected if a WRSR, program or erase operation is in progress.

Command sequence:

Drive CS# low --> Send 03h command into SI pin --> Send 24-bit address into SI pin --> Receive output data on SO pin --> Drive CS# high.

Figure 9: Read Data Bytes (READ) (03h) Command Sequence

8.7. Read Data Bytes at Higher Speed (Fast Read) (0Bh)

The Fast Read command has one more dummy byte after the 3-byte address compared with the READ command. Command and address are latched in on SCLK rising edge; output data shifts out on SCLK falling edge at a maximum clock frequency of f_{c3} .

Command sequence:

Drive CS# low --> Send 0Bh command into SI pin --> Send 24-bit address into SI pin --> 8 dummy SCLK cycles --> Receive output data on SO pin --> Drive CS# high.

Figure 10: Read Data Bytes at Higher Speed (Fast Read) (0Bh) Command Sequence

8.8. Dual Output Fast Read (3Bh)

The 3Bh command is followed by 3-byte address and a dummy byte, and then two bits of data is shifted out per SCLK cycle on SI and SO pins. The address can point to any location in the main memory array, and it automatically increments to the next byte address after each byte of data is shifted out.

During the execution of 3Bh command, SI is a bidirectional IO which first acts as an input of command and address and then becomes an output for read data.

Command sequence:

Drive CS# low --> Send 3Bh command into SI pin --> Send 24-bit address into SI pin --> 8 dummy SCLK cycles --> Receive output data on SO/SI pin --> Drive CS# high.

Figure 11: Dual Output Fast Read (3Bh) Command Sequence

8.9. Quad Output Fast Read (6Bh)

The 6Bh command is followed by 3-byte address and 8 dummy clocks, and outputs four bits of data through IO3, IO2, IO1 and IO0 on each falling edge of SCLK. The first address can be any location in the main memory array; it automatically increments to the next byte address after each byte of data is shifted out.

The QE bit should be set before the 6Bh command is issued.

During the execution of 6Bh command, SI is a bidirectional IO which first acts as an input of command and address and then becomes an output for read data.

Command sequence:

Drive CS# low --> Send 6Bh command into SI pin --> Send 24-bit address into SI pin --> 8 dummy SCLK cycles --> Receive output data on HOLD#/WP#/SO/SI pin --> Drive CS# high.

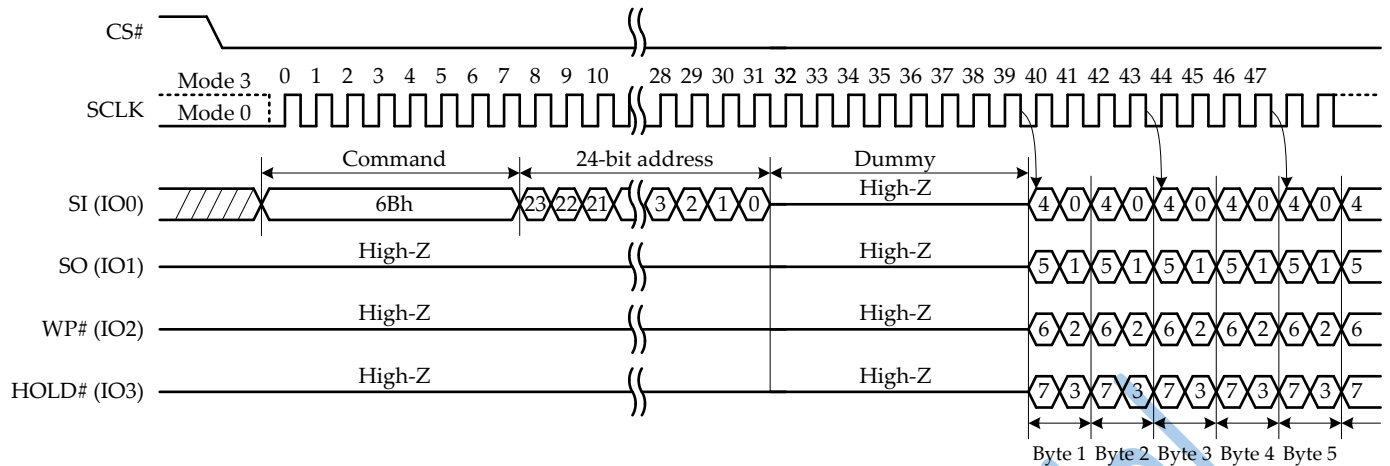

Figure 12: Quad Output Fast Read (6Bh) Command Sequence

8.10. Dual I/O Fast Read (BBh)

The BBh command is followed by 3-byte address and a "Continuous Read Mode" byte. Two dummy clocks are inserted. Address bytes and Mode bytes are latched in 2 bits per SCLK cycle on SI and SO pins, and then the memory content is shifted out 2 bits per clock cycle on the falling edge of SCLK. The first byte addressed can be at any location. The address automatically increments to the next byte after each byte is shifted out.

The "Continuous Read Mode" bits can further reduce command overhead. If (M5, M4) are (1, 0), then the command word BBh is not required for the next Dual I/O Fast Read command; otherwise, the device returns to normal operation mode and requires explicit command word for the next instruction. A Software Reset command (66h+99h) can reset (M5, M4) and bring the device back to normal operation.

Command sequence:

Drive CS# low --> Send BBh command into SI pin --> Send 24-bit address into SO/SI pin --> 4 dummy SCLK cycles --> Receive output data on SO/SI pin --> Drive CS# high.

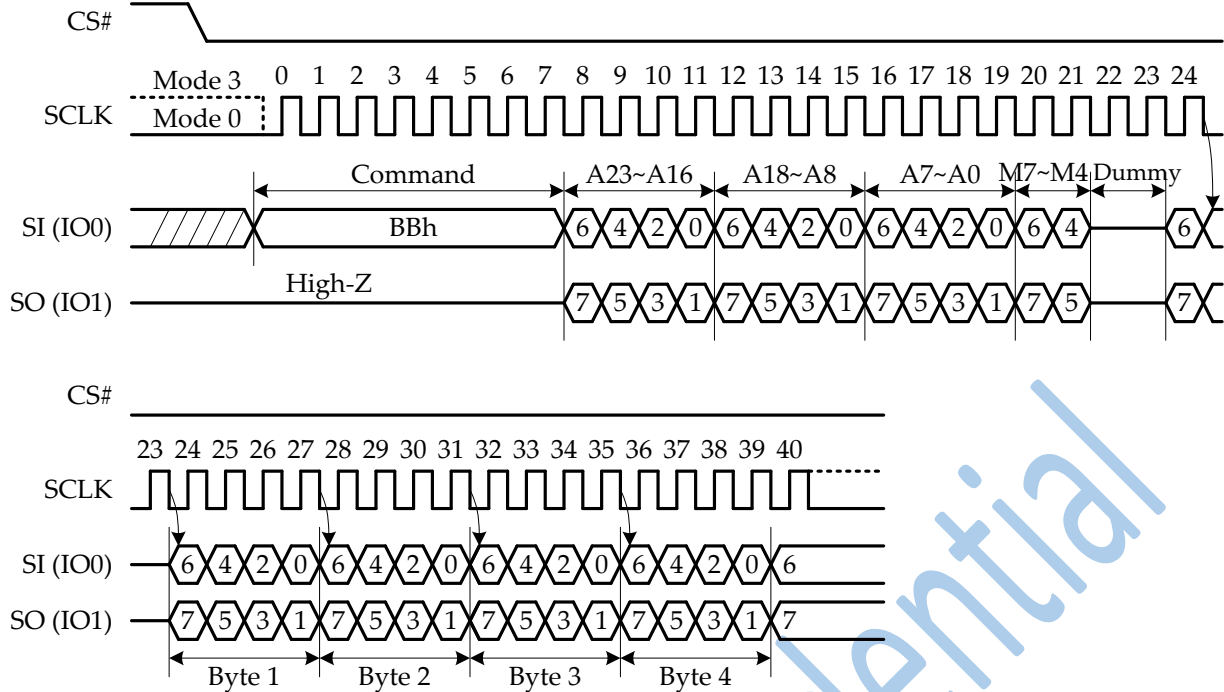

Figure 13: Dual I/O Fast Read (BBh) Command Sequence

8.10.1. Continuous Read Mode

If a previous BBh command has already set (M5, M4) to (1, 0), then the next Dual I/O Fast Read operation does not need the BBh opcode.

Command sequence:

Drive CS# low --> Send 24-bit address into SO/SI pin --> 4 dummy SCLK cycles --> Receive output data on SO/SI pin --> Drive CS# high.

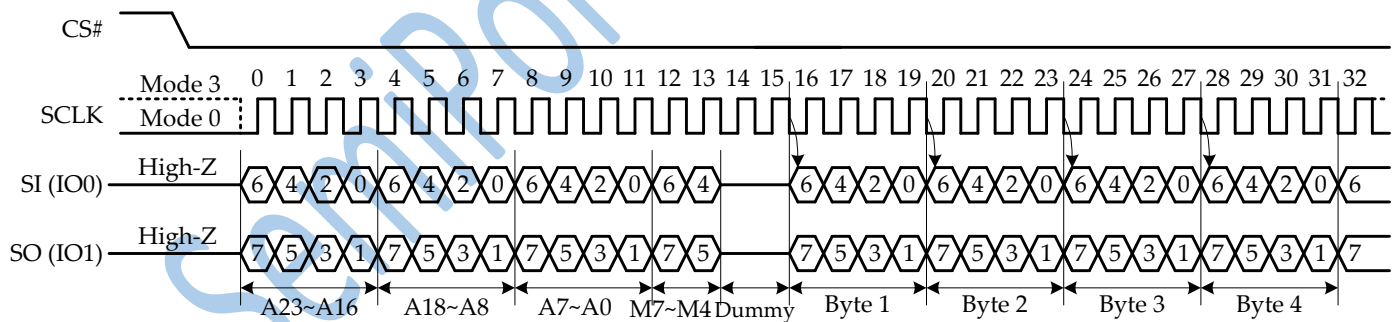

Figure 14: Dual I/O Fast Read (BBh) Command Sequence

8.11. Quad I/O Fast Read (EBh)

The EBh command is similar to the BBh command except that it uses all four data pins IO0, IO1, IO2 and IO3 for address input, Continuous Read Mode bits input, dummy cycles and all output data bytes.

The QE bit must be set to 1 prior to EBh command.

Command sequence:

Drive CS# low --> Send EBh command into SI pin --> Send 24-bit address into HOLD#/WP#/SO/SI pin --> 6 dummy SCLK cycles --> Receive output data on HOLD#/WP#/SO/SI pin --> Drive CS# high.

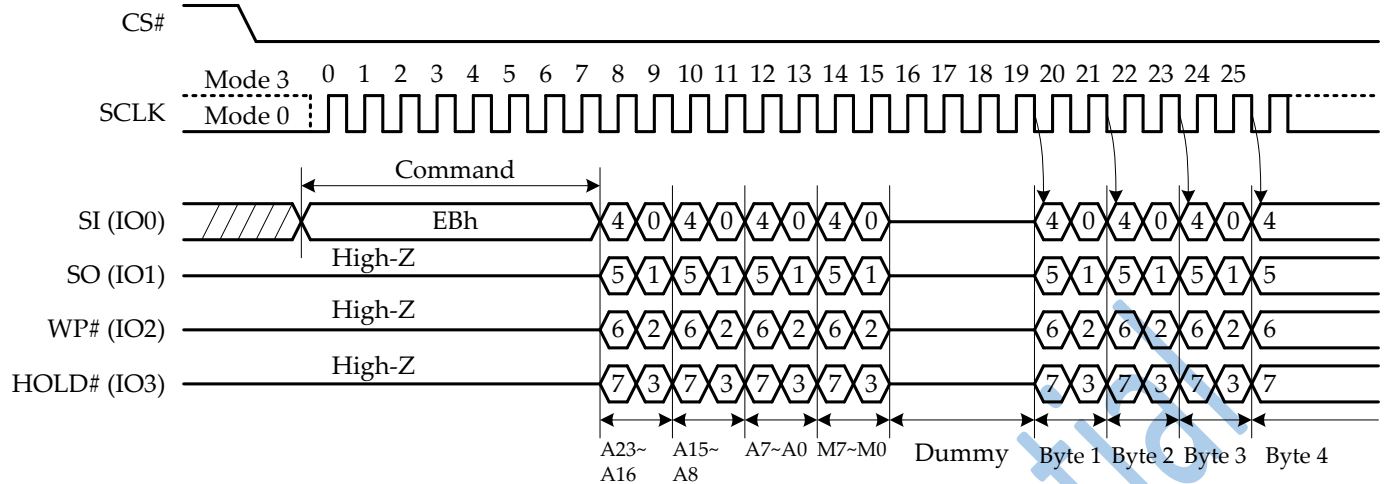

Figure 15: Quad I/O Fast Read (EBh) Command Sequence, (M5, M4) \neq (1, 0)

8.11.1. Continuous Read Mode

The Quad I/O Fast Read command can further reduce command overhead by setting the "Continuous Read Mode" bits (M7-M0) after the 3-byte address (A23-A0).

If (M5-M4) of the current transfer is (1, 0), then the next operation after CS# toggles high and then low is automatically recognized as Quad I/O Fast Read and does not require an explicit EBh opcode; otherwise, if (M5-M4) of the current transfer is not (1, 0), then the device keeps in normal state and requires an explicit input of command word for the next operation.

The Software Reset (66h+99h) command resets (M5-M4) bits and brings the device back to normal state.

Command sequence:

Drive CS# low --> Send 24-bit address into HOLD#/WP#/SO/SI pin --> 6 dummy SCLK cycles --> Receive output data on HOLD#/WP#/SO/SI pin --> Drive CS# high.

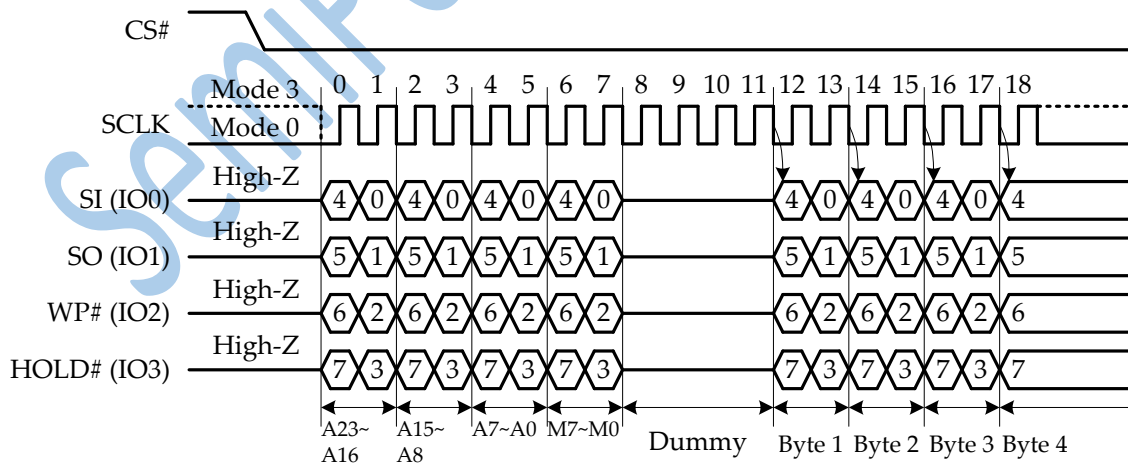

Figure 16: Quad I/O Fast Read (EBh) Command Sequence, (M5, M4) = (1, 0)

8.11.2. Quad I/O Fast Read with "8/16/32/64-Byte Wrap Around" in Standard SPI mode

The Quad I/O Fast Read command can access a specific portion within a page by issuing "Set Burst with Wrap" (77h) command prior to EBh. The 77h command enables or disables the "Wrap Around" feature for the following EBh command by setting the W4, W5 and W6 bits.

The "Wrap Around" feature is reset by the following operations:

Power up;

Software Reset (66h + 99h) Command;

Another 77h command that resets W4, W5 and W6 bits.

This feature allows applications that use cache to quickly fetch data from a critical address and then fill the cache with a fixed length (8-, 16-, 32- or 64-byte) of data without issuing multiple read commands.

8.12. Quad I/O Word Fast Read (E7h)

E7h is similar to EBh command with the exception that the lowest address bit (A0) must be 0 and that there are only two dummy clocks. The first address can point to any location in the main array; after each byte is output, the address automatically increments to the next byte address.

This command requires the QE bit to be set.

Command sequence:

Drive CS# low --> Send E7h command into SI pin --> Send 24-bit address into HOLD#/WP#/SO/SI pin --> 4 dummy SCLK cycles --> Receive output data on HOLD#/WP#/SO/SI pin --> Drive CS# high.

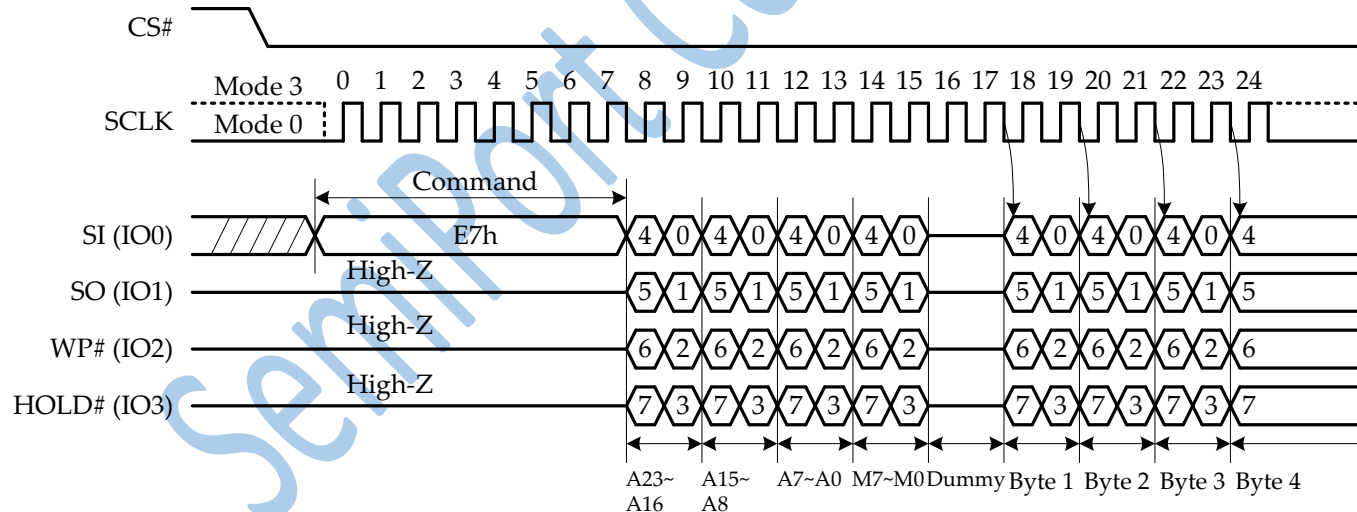

Figure 17: Quad I/O Word Fast Read (E7h) Command Sequence, (M5~M4) ≠ (1, 0)

8.12.1. Continuous Read Mode

The E7h command can further reduce command overhead using "Continuous Read Mode" bits M7~M0. If (M5~M4) is (1, 0), then the next operation after CE# goes high and then low remains in the state of Quad I/O Word Fast Read, and does not require the E7h opword; otherwise, the device just remains in normal mode.

Command sequence:

Drive CS# low --> Send 24-bit address into HOLD#/WP#/SO/SI pin --> 4 dummy SCLK cycles --> Receive

output data on HOLD#/WP#/SO/SI pin --> Drive CS# high.

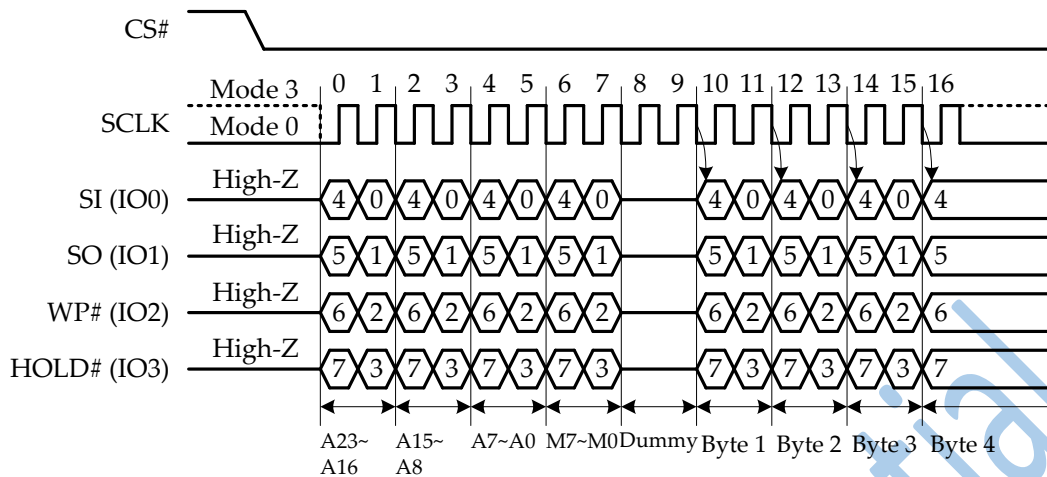

Figure 18: Quad I/O Word Fast Read (E7h) Command Sequence, (M5~M4) = (1, 0)

Quad I/O Word Fast Read with "8-, 16-, 32- or 64-Byte Wrap Around" in Standard SPI mode

The Quad I/O Word Fast Read (E7h) command can access a specific portion within a page by issuing "Set Burst with Wrap" (77h) command prior to E7h. The 77h command enables or disables the "Wrap Around" feature for the following E7h commands by setting the W4, W5 and W6 bits.

The "Wrap Around" feature is reset by the following operations:

- Power up
- Software Reset (66h + 99h) Command
- Another 77h command that resets W4, W5 and W6 bits

This feature allows applications that use cache to quickly fetch data from a critical address and then fill the cache with a fixed length (8-, 16-, 32- or 64-byte) of data without issuing multiple read commands.

8.13. Set Burst with Wrap (77h)

The "Set Burst with Wrap" command 77h command allows three "Wrap Bits" W4 through W6 to be set. When 77h is used with EBh or E7h command, certain combinations of W4, W5 and W6 bits enable the EBh/E7h command to iteratively access a fixed length of 8-, 16-, 32- or 64-byte section within a 256-byte page.

The W4 bit enables or disables the "Wrap Around" operation. When W4 is 0, the Wrap Around mode is enabled and (W6, W5) specify the length of the wrap around section within a page. Once the W6~W4 bits are set, they apply to all upcoming EBh and E7h commands until the next power-up.

The W6~W4 bits are reset by:

- Power up;
- Software Reset (66h+99h) Command;
- Another 77h command that resets W4, W5 and W6 bits.

Table 16: Wrap Bit Definition

W6, W5	W4=0	W4=1 (Default)
--------	------	----------------

	Wrap Around	Wrap Length	Wrap Around	Wrap Length
0, 0	Yes	8-byte	No	N/A
0, 1	Yes	16-byte	No	N/A
1, 0	Yes	32-byte	No	N/A
1, 1	Yes	64-byte	No	N/A

Figure 19: Set Burst with Wrap (77h) Command Sequence

8.14. Page Program (PP) (02h)

The PP command programs data to a specified location in the main memory array. The maximum amount of data to program in one PP operation is 256 bytes. WEL bit must be set to enable the device for programming operation. Attempting to program a memory location that has previously been programmed but not erased may corrupt the data.

The command sequence is as follows:

Drive CS# low --> Send in 02h opcode --> Send in three address bytes --> Send in data --> Drive CS# high.

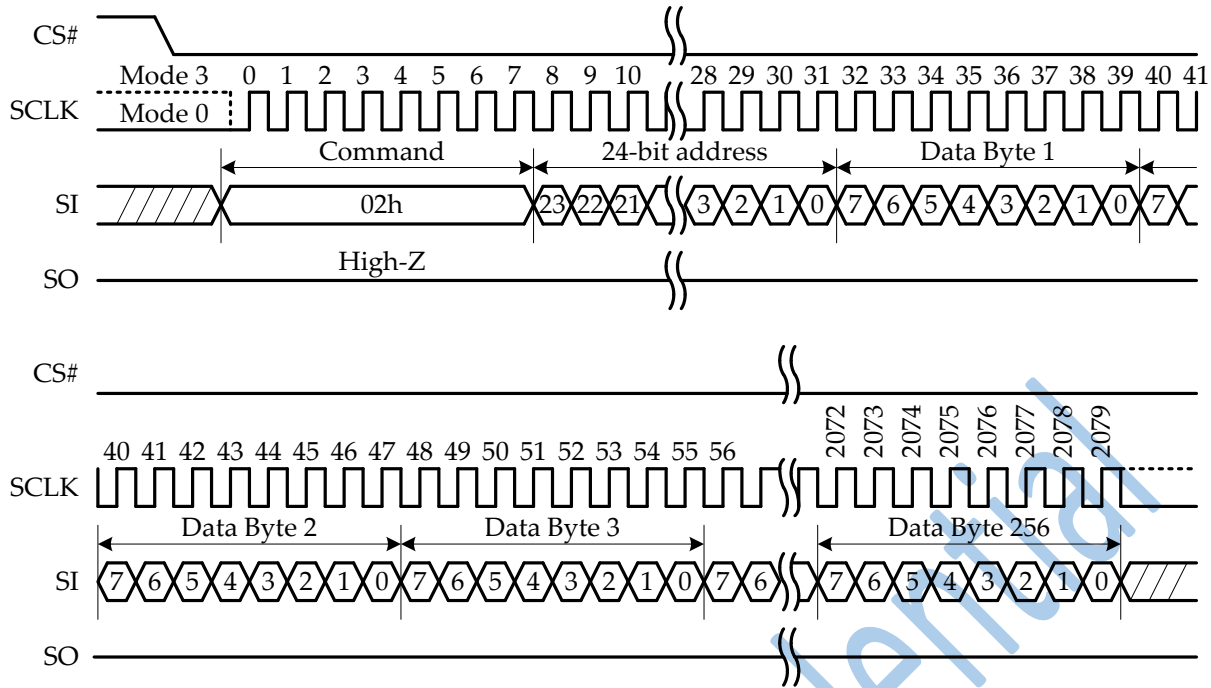

Figure 20: Page Program (PP) (02h) Command Sequence

The address specified in the 02h command is the starting address of the program operation; this address can point to any location in the main memory array. The host may send in an arbitrary amount of data, however when the address points to the ending boundary of the current page, it automatically rolls back to the starting boundary of that page. Thus, all data bytes of a PP command fall within a single 256-byte page in the main array.

If more than 256 bytes of data are sent to the device, only the last 256 bytes take effect, and all previously latched data are discarded. If less than 256 data bytes are sent, they can be correctly programmed at the target addresses without affecting other bytes in the same page.

The CS# pin must be driven high exactly at a byte boundary, otherwise the command is ignored. After CS# is driven high, a self-timed Page Program cycle (t_{PP}) is initiated. While the Page Program cycle is in progress, it is recommended to continuously check the WIP bit in the Status Register. After the programming cycle is complete, the WEL bit is reset to 0.

A Page Program (PP) command applied to a page which is protected by Block Protect bits (BP4, BP3, BP2, BP1, and BP0) is not executed.

8.15. Dual Input Page Program (A2h)

The Dual Input Page Program command is for programming the memory using two pins: IO0, IO1. The A2h command programs data to a specified location in the main memory array. The maximum amount of data to program in one PP operation is 256 bytes. WEL bit must be set to enable the device for programming operation. Attempting to program a memory location that has previously been programmed but not erased may corrupt the data.

The command sequence is shown in Figure 14. If more than 256 Bytes are sent to the device, previously latched data are discarded and the last 256 data Bytes are guaranteed to be programmed correctly within the same page. If less than 256 data Bytes are sent to device, they are correctly programmed at the requested addresses without having any effects on the other Bytes of the same page. CS# must be driven high after the eighth bit of the last data

Byte has been latched in; otherwise the Dual Input Page Program command is not executed.

The command sequence is as follows:

Drive CS# low --> Send in A2h opcode --> Send in three address bytes --> Send in data --> Drive CS# high.

Figure 21: Dual Input Page Program (A2h) Command Sequence

8.16. Quad Page Program (32h)

The 32h command uses IO0, IO1, IO2 and IO3 pins to program data to a specified location in the main memory array. The maximum amount of data to program in one Quad Page Program operation is 256 bytes. WEL bit must be set to enable the device for programming operation. Attempting to program a memory location that has previously been programmed but not erased may corrupt the data. QE bit must be set to use 32h command.

The command sequence is as follows:

Drive CS# low --> Send in 32h opcode --> Send in three address bytes --> Send in data, four bits per SCLK cycle --> Drive CS# high.

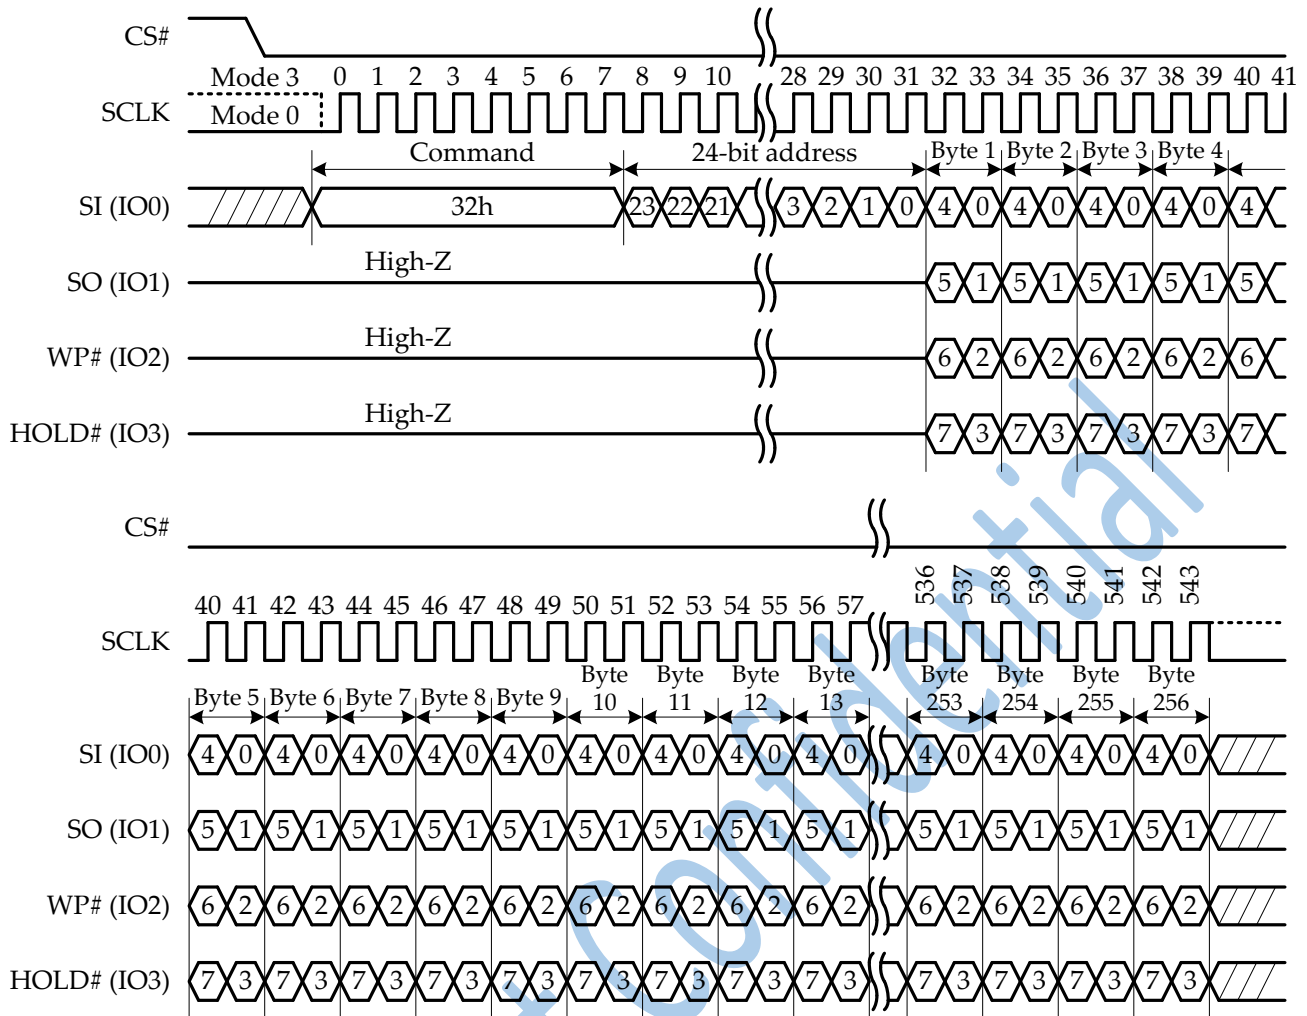

Figure 22: Quad Page Program (32h) Command Sequence

The address specified in the 32h command is the starting address of the program operation; this address can point to any location in the main memory array. The host may send in an arbitrary amount of data, however when the address points to the ending boundary of the current page, it automatically rolls back to the starting boundary of that page. Thus, all data bytes of a 32h command fall within a single 256-byte page in the main array.

If more than 256 bytes of data are sent to the device, only the last 256 bytes take effect, and all previously latched data are discarded. If less than 256 data bytes are sent, they can be correctly programmed at the target addresses without affecting other bytes in the same page.

After CS# is driven high, a self-timed Quad Page Program cycle (t_{PP}) is initiated. While the Quad Page Program cycle is in progress, it is recommended to continuously check the WIP bit in the Status Register. After the programming cycle is complete, the WEL bit is reset to 0.

A 32h command applied to a page which is protected by Block Protect bits (BP4, BP3, BP2, BP1, and BP0) is not executed.

8.17. 0.5KB Sector Erase (SE1K) (8Ah)

The Sector Erase 1K(SE1K) command is used to erase all the data of the chosen sector. A Write Enable (WREN) command must previously have been executed to set the Write Enable Latch (WEL) bit. The Sector Erase 0.5K (SE05K) command is entered by driving CS# low, followed by the command code, and 3-address Byte on DI. Any

address inside the sector is a valid address for the Sector Erase 1K (SE1K) command. CS# must be driven low for the entire duration of the sequence.

The command sequence is as follows:

Drive CS# low --> Send in 8Ah opcode --> Send 3 bytes of address on SI --> Drive CS# high.

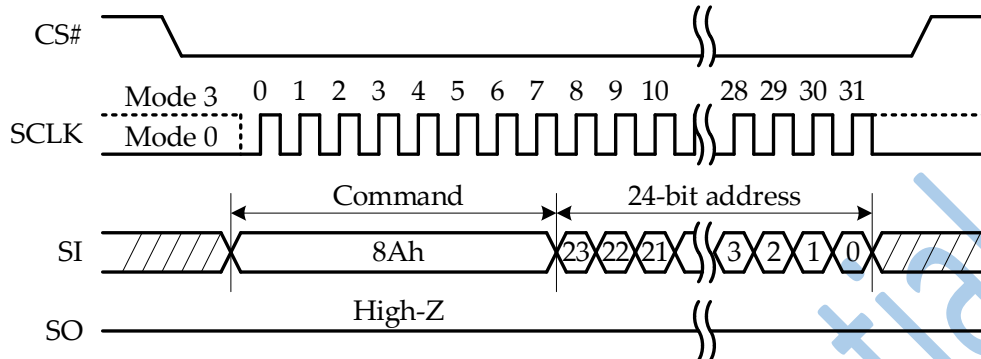

Figure 23: 1K Sector Erase Command Sequence

8.18. Fast Page Program (FPP) (F2h)

The Fast Page Program command programs data to a specified location in the main memory array. The maximum amount of data to program in one operation is 256 bytes. WEL bit must be set to enable the device for programming operation. Attempting to program a memory location that has previously been programmed but not erased may corrupt the data.

The command sequence is as follows:

Drive CS# low --> Send in F2h opcode --> Send in three address bytes --> Send in data --> Drive CS# high.

Figure 24: Fast Page Program (FPP) (F2h) Command Sequence

The address specified in F2h command is the starting address of the program operation; this address can point to any location in the main memory array. The host may send in an arbitrary amount of data, however when

the address points to the ending boundary of the current page, it automatically rolls back to the starting boundary of that page. Thus, all data bytes of a Fast PP command fall within a single 256-byte page in the main array.

If more than 256 bytes of data are sent to the device, only the last 256 bytes take effect, and all previously latched data are discarded. If less than 256 data bytes are sent, they can be correctly programmed at the target addresses without affecting other bytes in the same page.

After CS# is driven high, a self-timed Page Program cycle (t_{PP}) is initiated. While the Page Program cycle is in progress, it is recommended to continuously check the WIP bit in the Status Register. After the programming cycle is complete, the WEL bit is reset to 0.

A Fast Page Program command applied to a page which is protected by Block Protect bits (BP4, BP3, BP2, BP1, and BP0) is not executed.

8.19. Sector Erase (SE) (20h)

SE command erases the specified 4KB sector and sets all bytes in the target sector to FFh. WREN command is required to set WEL bit prior to an erase operation. Any address within the sector is a valid address for the SE command.

The command sequence is as follows:

Drive CS# low --> Send in 20h opcode --> Send 3 bytes of address on SI --> Drive CS# high.

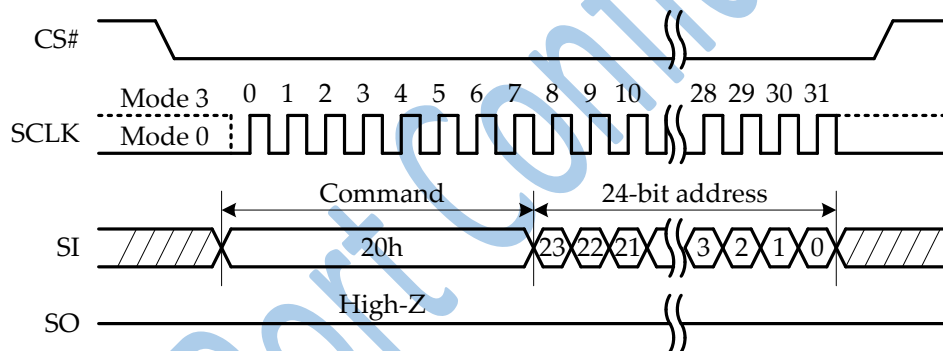

Figure 25: Sector Erase (SE) (20h) Command Sequence

The CS# pin must be driven high after the eighth bit of the 3-byte address input, otherwise the erase operation is not executed. After CS# is driven high, the device internally initiates a self-timed Sector Erase cycle (t_{SE}). It is recommended to poll WIP bit continuously while an SE operation is in progress. WIP is 1 during the self-timed Sector Erase cycle, and becomes 0 when it is complete. At some unspecified time before the erase cycle is complete, the WEL bit is reset.

A Sector Erase command applied to a sector which is protected by Block Protect bits (BP4, BP3, BP2, BP1, BP0) is not executed.

8.20. 32KB Block Erase (BE) (52h)

32KB BE command erases the specified 32KB Block and sets all bytes in the target block to FFh. WREN command is required to set WEL bit prior to an erase operation. Any address within the 32KB block is a valid address for the BE command.

The command sequence is as follows:

Drive CS# low --> Send in 52h opcode --> Send 3 bytes of address on SI --> Drive CS# high.

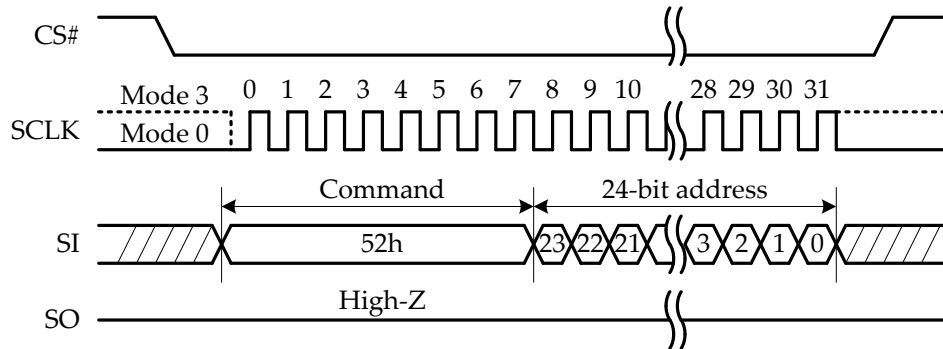

Figure 26: 32KB Block Erase (BE) (52h) Command Sequence

The CS# pin must be driven high after the eighth bit of the 3-byte address input, otherwise the erase operation is not executed. After CS# is driven high, the device internally initiates a self-timed Block Erase cycle (t_{BE}). It is recommended to poll WIP bit continuously while a BE operation is in progress. WIP is 1 during the self-timed Block Erase cycle, and becomes 0 when it is complete. At some unspecified time before the erase cycle is complete, the WEL bit is reset.

A Block Erase command applied to a sector which is protected by Block Protect bits (BP4, BP3, BP2, BP1, BP0) is not executed.

8.21. 64KB Block Erase (BE) (D8h)

64KB BE command erases the specified 64KB Block and sets all bytes in the target block to FFh. WREN command is required to set WEL bit prior to an erase operation. Any address within the 64KB block is a valid address for the BE command.

The command sequence is as follows:

Drive CS# low --> Send in D8h opcode --> Send 3 bytes of address on SI --> Drive CS# high.

Figure 27: 64KB Block Erase (BE) (D8h) Command Sequence

The CS# pin must be driven high after the eighth bit of the 3-byte address input, otherwise the erase operation is not executed. After CS# is driven high, the device internally initiates a self-timed Block Erase cycle (t_{BE}). It is recommended to poll WIP bit continuously while a BE operation is in progress. WIP is 1 during the self-timed Block Erase cycle, and becomes 0 when it is complete. At some unspecified time before the erase cycle is complete, the WEL bit is reset.

A Block Erase command applied to a sector which is protected by Block Protect bits (BP4, BP3, BP2, BP1, BP0) is not executed.

8.22. Chip Erase (CE) (60h/C7h)

Chip Erase command erases the entire main memory array and sets all bytes in the array to FFh. WREN command is required to set WEL bit prior to an erase operation.

The command sequence is as follows:

Drive CS# low --> Send in 60h or C7h opcode --> Drive CS# high.

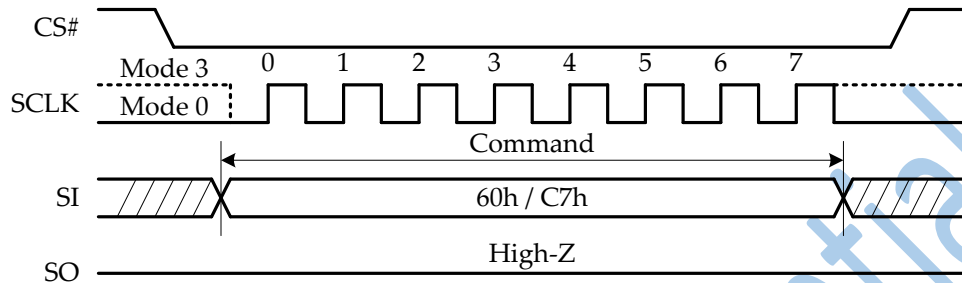

Figure 28: Chip Erase (CE) (60h/C7h) Command Sequence

The CS# pin must be driven high after the eighth bit of the command input, otherwise the erase operation is not executed. After CS# is driven high, the device internally initiates a self-timed Chip Erase cycle (t_{CE}). It is recommended to poll WIP bit continuously while a CE operation is in progress. WIP is 1 during the self-timed Chip Erase cycle, and becomes 0 when it is complete. At some unspecified time before the erase cycle is complete, the WEL bit is reset.

When a Chip Erase command is applied to a device, if any part of the main array is protected by Block Protect bits (BP4, BP3, BP2, BP1, BP0), then the command is not executed.

8.23. Deep Power-Down (DP) (B9h)

DP command is the only way to bring the device into Deep Power-Down mode. In this mode, the supply current is reduced from standby current I_{CC1} to I_{CC2} . In this state, the device ignores all commands except "Release from Deep Power-Down and Read Device ID" (RDI) command. This command offers an extra software protection mechanism that protects the device from all WRSR, program or erase commands.

The command sequence is as follows:

Drive CS# low --> Send in B9h opcode --> Drive CS# high.

Figure 29: Deep Power-Down (DP) (B9h) Command Sequence

The CS# pin must be driven high after the eighth bit of the command input, otherwise the operation is not executed. As soon as CS# is driven high, the device first returns to standby mode if no internal WRSR, program

or erase operation is in progress. After a delay of t_{DP} , the device enters Deep Power-Down Mode and current consumption is greatly reduced.

RDI command and power-down can release the device from Deep Power-Down mode and bring it back to standby mode. A DP command while WRSR, program or erase operation is in progress that can be ignored.

8.24. Read Unique ID (4Bh)

The Read Unique ID command accesses a factory-set read-only 128-bit number which is unique to each SP25WQ16A device. The ID number can be used in conjunction with user software methods to help prevent illegal copying or cloning of a system.

The command sequence is as follows:

Drive CS# pin low --> Shift in the 4Bh opcode --> Four bytes of dummy clocks --> Shift out the 128-Bit ID.

Data is shifted out on the falling edge of SCLK.

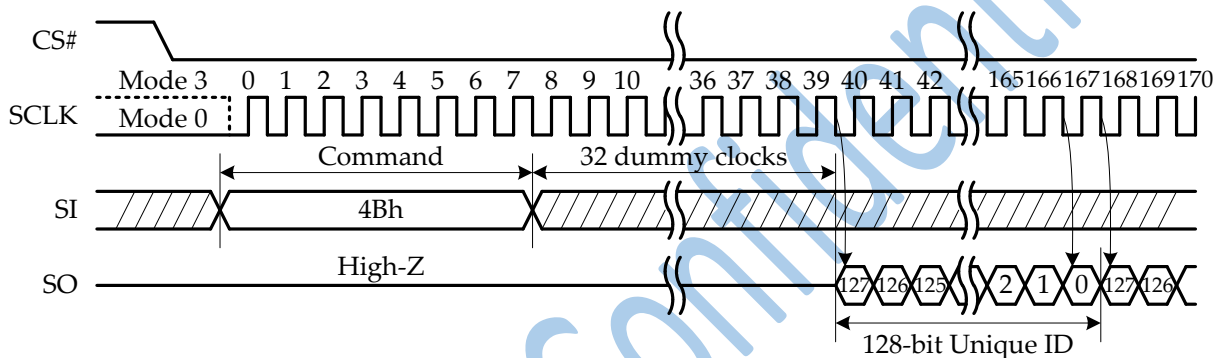

Figure 30: Read Unique ID (4Bh) Command Sequence

8.25. Release from Deep Power-Down and Read Device ID (RDI) (ABh)

When issued alone and without any dummy cycles, the ABh command releases the device from Deep Power-Down state or High Performance Mode.

If the device is previously in Deep Power-Down mode, then after CS# transitions high, it takes t_{RES1} before the device resumes normal operation and other commands are accepted. The CS# pin must remain high during t_{RES1} ; if the device is not previously in Deep Power-Down mode, then the transition to normal operation is immediate after CS# is deasserted.

If the ABh command is issued while a WRSR, program or erase operation is in progress, then the command is ignored

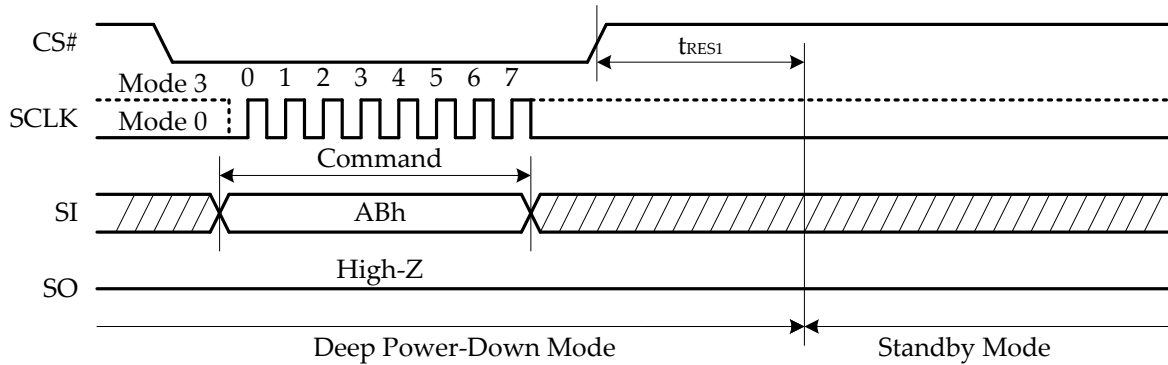

Figure 31: Release Power-Down (ABh) Command Sequence

If the device is previously in deep power-down mode, ABh can release the device from Deep Power-Down mode and obtain Device ID. The opcode is followed by three dummy bytes and the Device ID output byte. After CS# transitions high, it must remain high for at least tRES2 before the device returns to normal operation and other commands can be accepted.

If the ABh command is issued while a WRSR, program or erase operation is in progress, then the command is ignored.

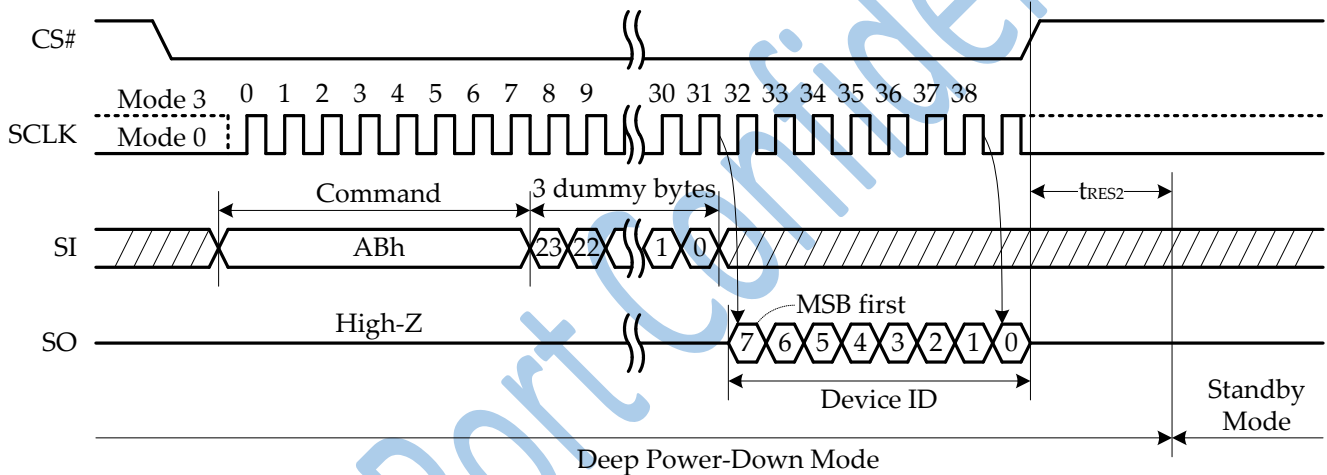

Figure 32: Release Power-Down and Read Device ID (ABh) Command Sequence

8.26. Read Manufacture ID / Device ID (REMS) (90h)

The 90h command provides both JEDEC assigned Manufacturer ID and Device ID. A 24-bit address is required following the 90h opcode. If address bit A0 is 0, then Manufacture ID is read out first; otherwise if A0 is 1, then Device ID is output first.

The command sequence is:

Drive CS# pin low --> Shift in 90h opcode --> Three bytes of address --> Shift out IDs.

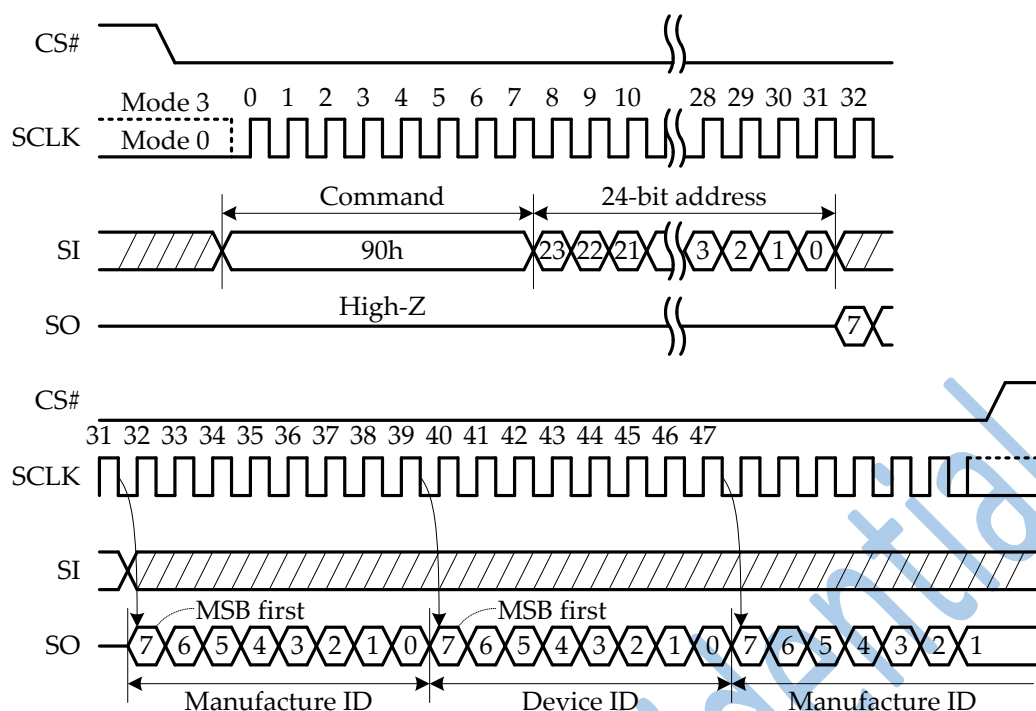

Figure 33: Read Manufacture ID / Device ID (REMS) (90h) Command Sequence

Data is shifted out on SCLK falling edge. As long as CS# is low, the two IDs are repetitively output in turns.

8.27. Dual I/O Read Manufacture ID / Device ID (92h)

The 92h command outputs Manufacture ID and Device ID. A 24-bit address and 8 mode bits are required following the 92h opcode. If address bit A0 is 0, then Manufacture ID is output first; otherwise if A0 is 1, then Device ID is output first. The mode bits in 92h command do not bring the device into continuous read mode.

The command sequence is:

Drive CS# pin low --> Shift in 92h opcode --> Three bytes of Address and one byte of Mode bits on IO0 and IO1 --> Shift out ID data on IO0 and IO1.

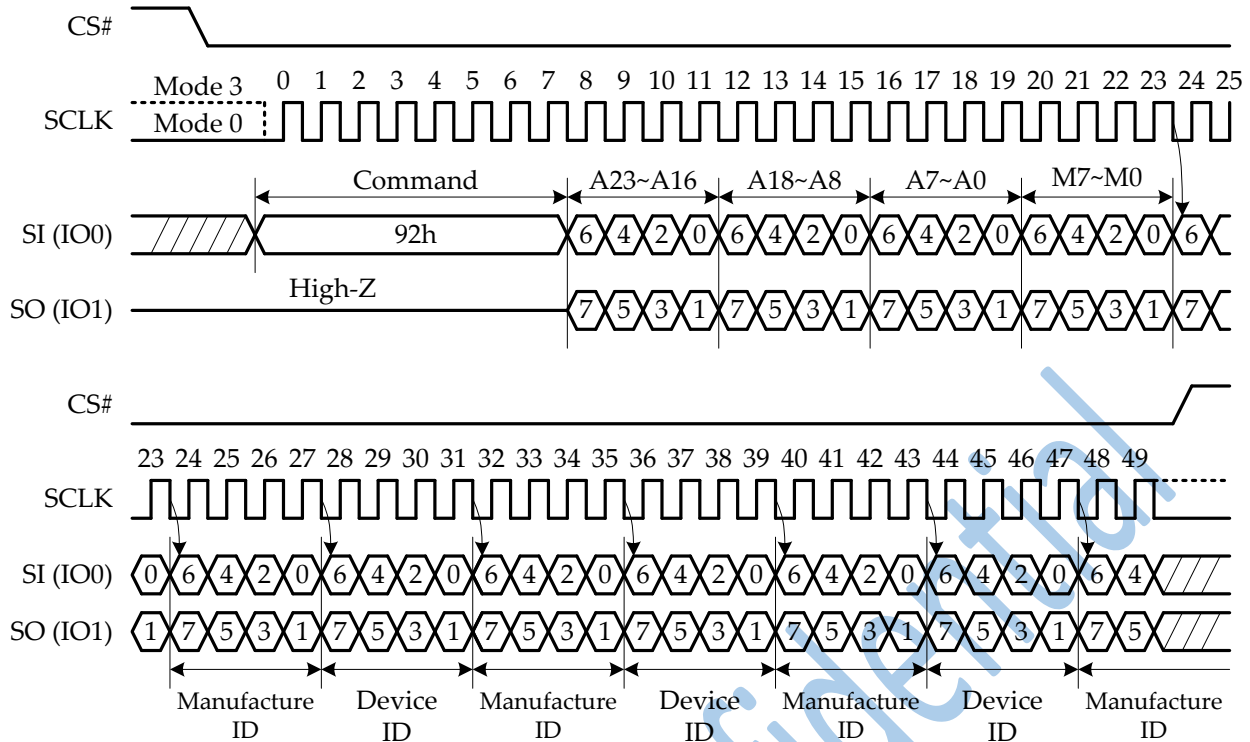

Figure 34: Dual I/O Read Manufacture ID / Device ID (92h) Command Sequence

Data is shifted out on SCLK falling edge. As long as CS# is low, the two IDs are repetitively output in turns.

8.28. Quad I/O Read Manufacture ID / Device ID (94h)

The 94h command outputs Manufacture ID and Device ID. A 24-bit address, 8 mode bits and four dummy clocks are required following the 94h opcode. If address bit A0 is 0, then Manufacture ID is output first; otherwise if A0 is 1, then Device ID is output first. The mode bits in 94h command do not bring the device into continuous read mode. The QE bit should be set before the 94h command is issued.

The command sequence is:

Drive CS# pin low --> Shift in 94h opcode --> Three bytes of Address and one byte of Mode bits on IO0, IO1, IO2 and IO3 --> Four dummy clocks --> Shift out ID data on IO0, IO1, IO2 and IO3 pins.

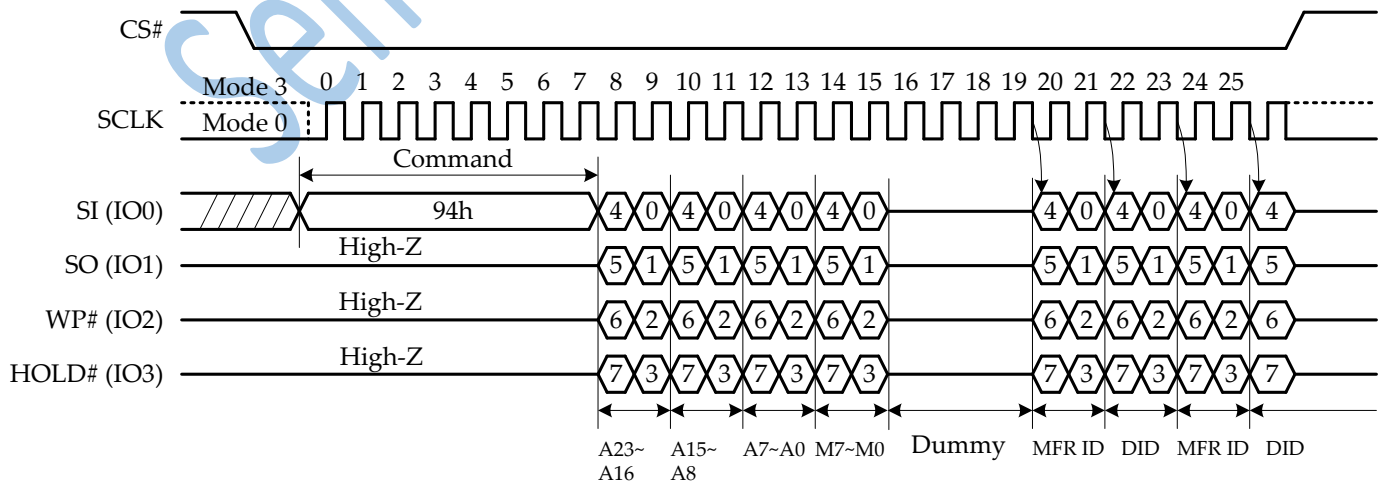

Figure 35: Quad I/O Read Manufacture ID / Device ID (94h) Command Sequence

Data is shifted out on SCLK falling edge. As long as CS# keeps low, the two IDs are repetitively output continuously.

8.29. Read Identification (RDID) (9Fh)

The 9Fh command outputs Manufacture ID, Memory Type and Memory Capacity ID codes. An RDID command during WRSR, program or erase cycle is ignored.

The command sequence is:

Drive CS# pin low --> Shift in 9Fh opcode --> Shift out Manufacture ID data byte --> Shift out memory type data byte --> Shift out memory capacity data byte.

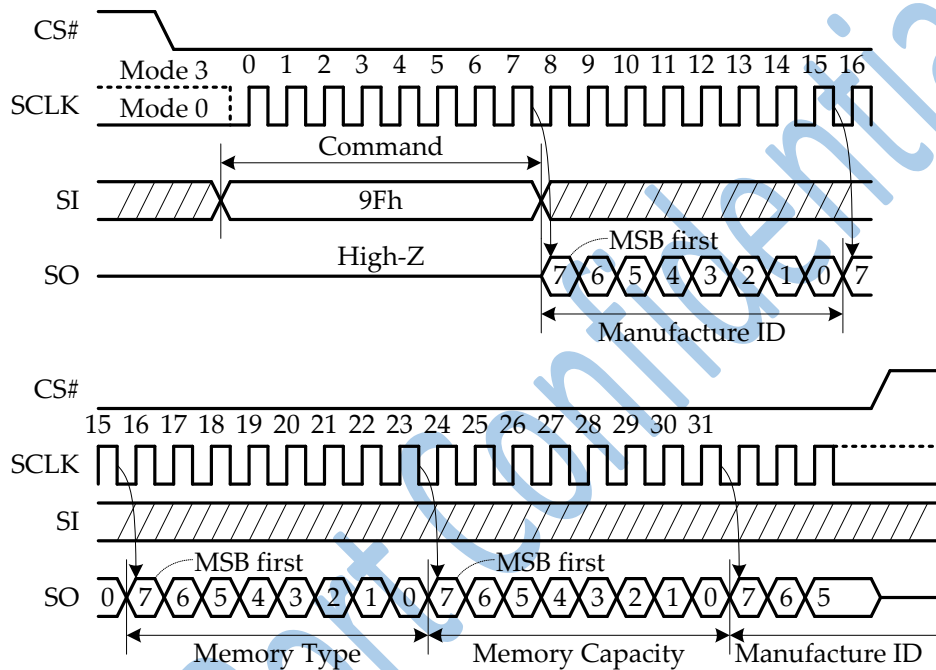

Figure 36: Read Identification (RDID) (9Fh) Command Sequence

Data is shifted out on SCLK falling edge. The host may terminate the command by driving CS# high at any time during data output. As long as CS# keeps low, the three IDs will be repetitively output in turns.

8.30. Program/Erase Suspend (PES) (75h)

The PES command is valid only during Page Program, Sector Erase or Block Erase commands. It allows the host to interrupt these operations and then read data from any other sector or block. A time duration of t_{sus} is required for the PES command to take effect.

The WRSR (01h, 31h, 11h), Erase/Program Security Registers (44h, 42h), Erase (8Ah, 20h, 52h, D8h, 60h, C7h) and Page Program commands (02h, 32h, A2h, F2h) are not allowed during Program Suspend.

The WRSR (01h, 31h, 11h), Erase Security Registers (44h) and Erase commands (8Ah, 20h, 52h, D8h, 60h, C7h) are not allowed during Erase Suspend.

Immediately following PES command, the WIP bit is cleared from 1 to 0 within t_{sus} , and the SUS2 or SUS1 bit is set from 0 to 1 depending on what operation is being suspended. Power down the device during suspension resets the device and releases it from suspend state.

Figure 37: Program/Erase Suspend (PES) (75h) Command Sequence

8.31. Program/Erase Resume (PER) (7Ah)

While the device is in Program or Erase Suspension, the host may issue a PER command to bring the device out of Suspension and resume the Program or Erase operation previously suspended.

The PER command requires that either SUS1 or SUS2 bit = 1, and WIP = 0. After PER command is accepted, the SUS1 or SUS2 bit is cleared to 0, and WIP is set to 1 within 200ns to indicate the Program or Erase operation that is back in progress.

If no Program or Erase operation is in suspension, the PER command is ignored.

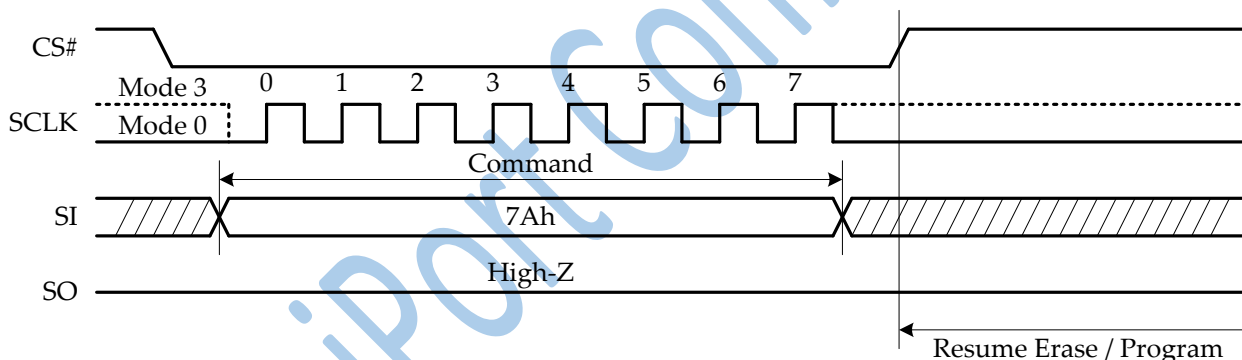

Figure 38: Program/Erase Resume (PER) (7Ah) Command Sequence

8.32. Erase Security Registers (44h)

The three 512-byte Security Registers of the SP25WQ16A device can be read, programmed or erased individually. The host may use Security Registers to store security or other important information separately from the main memory array.

Similar to Sector Erase and Block Erase commands, the 44h command requires that a WREN command be issued to set WEL bit = 1. The 44h command erases one of the three 512-bit Security Registers;

the command sequence is as follows:

Drive CS# low --> Shift in 44h command --> Send 3-byte address on SI pin --> Drive CS# high.

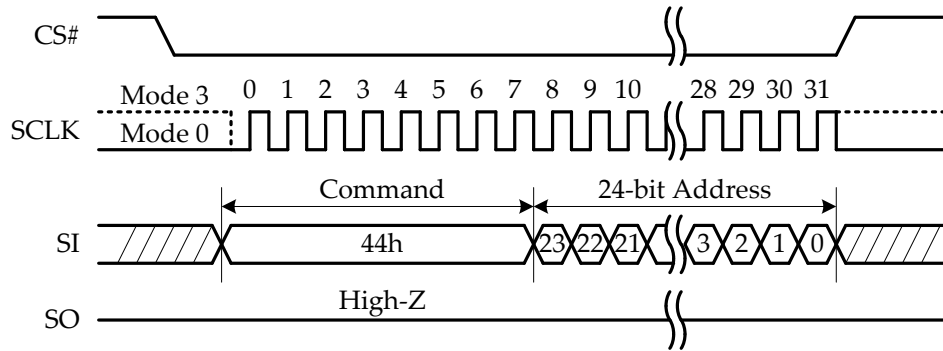

Figure 39: Erase Security Registers (44h) Command Sequence

The address definition of 44h command is specified in 5.3 Security Register. The CS# pin must be driven high after the last bit of address input, otherwise the command is ignored by the device.

After CS# transitions high, a self-timed Erase Security Registers cycle (t_{SE}) is initiated. The host may check the WIP bit while an erase cycle is in progress: the WIP bit is 1 during the self-timed Erase cycle, and is 0 when it is completed. At some unspecified time before the Erase cycle is completed, the WEL bit is reset.

Optionally, the Lock Bits (LB3, LB2, LB1) can each OTP protect a corresponding Security Register. Once protected, the Security Register is permanently protected against erase or program operations.

8.33. Program Security Registers (42h)

The Program Security Register command programs data to a specified location in the Security Registers. WEL bit must be set to enable the device for programming operation. Attempting to program a memory location that has previously been programmed but not erased may corrupt the data.

The command sequence is as follows:

Drive CS# low --> Send in 42h opcode --> Send in 3-byte address -> Send in data -> Drive CS# high.

Figure 40: Program Security Registers (42h) Command Sequence

8.34. Read Security Registers (48h)

The Read Security Registers command is similar to Fast Read command. It outputs data bits at a maximum frequency of f_c . The first address can point to any location within a Security Register. The address automatically increments to the next byte address after each byte is shifted out. If the last byte address is reached, then the pointer will wrap back to the first byte address in the target Security Register.

The command sequence is as follows:

Drive CS# low --> Send in 48h opcode --> Send in 3-byte address --> One dummy byte --> Shift out read data on SO at SCLK falling edge.

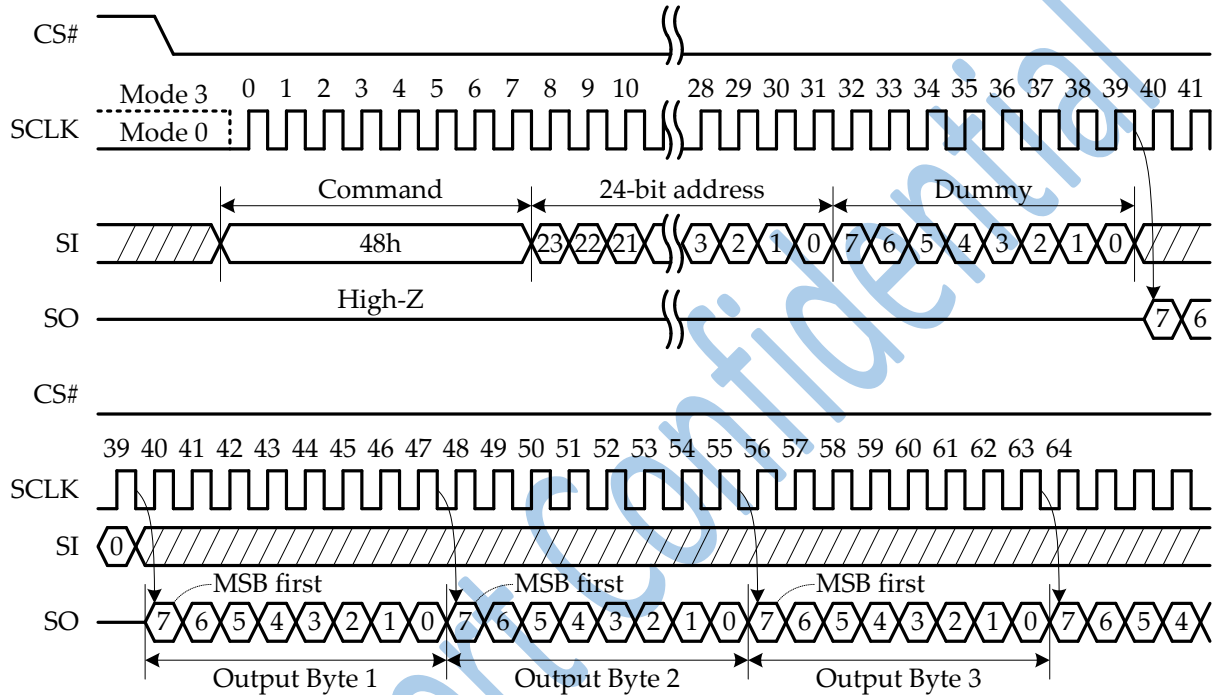

Figure 41: Read Security Registers (48h) Command Sequence

The address definition of 48h command is specified in 5.3 Security Register.

8.35. Enable Reset (66h) and Software Reset (99h)

The Software Reset command aborts all on-going internal operations, and brings the device back to its default power-on state. All volatile settings are lost, including Volatile Status Register bits, WEL, Continuous Read Mode bit setting (M7-M0). The command sequence is as follows.

The command sequence is as follows:

Drive CS# low --> Send in 66h opcode --> Drive CS# high --> Drive CS# low --> Send in 99h opcode --> Drive CS# high.

Figure 42: Enable Reset (66h) and Reset (99h) Command Sequence

After CS# goes high, the software reset process takes t_{RST_R} , during which no command is accepted.

Data corruption may occur if Software Reset command is used to interrupt an ongoing or suspended program or erase operation. To prevent this, it is recommended to check WIP, SUS2 and SUS1 bits before issuing this command.

8.36. Read Serial Flash Discoverable Parameter (5Ah)

The SFDP information is stored in a standard set of tables, which contain the functional and feature capabilities of the device. These tables can be interrogated by host to make adjustments needed to accommodate to different features from multiple vendors. SFDP is a JEDEC Standard (JESD216).

The address definition of 5Ah command is specified in 5.43 SFDP Register.

Figure 43: Read Serial Flash Discoverable Parameter (5Ah) Command Sequence

8.37. Continuous Read Mode Reset (CRMR) (FFh)

The Dual I/O Fast Read operations, “Continuous Read Mode” bits (M7-0) are implemented to further reduce command overhead. By setting the (M7-0) to AXH, the next Dual I/O Fast Read operations do not require the BBH command code.

Because SP25WQ16A the has no hardware reset pin, so if Continuous Read Mode bits are set to “AXH”, the SP25WQ16A will not recognize any standard SPI commands. So Continuous Read Mode Reset command will release the Continuous Read Mode from the “AXH” state and allow standard SPI command to be recognized. The command sequence is show in Figure 32.

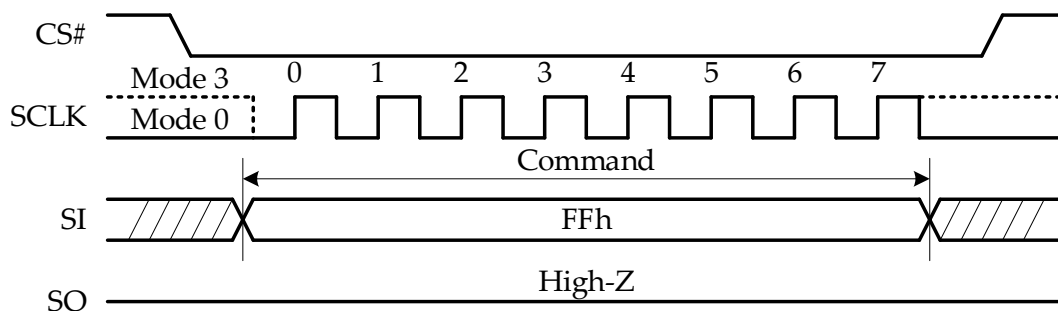

Figure 44: Continuous Read Mode Reset Command Sequence

9. Electrical Characteristics

9.1. Power-On Timing

Figure 45: Power-On Timing Diagram

Table 17: Power-On Timing and Write Inhibit Threshold

Symbol	Comments	Min	Max	Unit
t_{vSL}	$V_{CC}(\min)$ to earliest CS# Low	50	500	us
V_{WI}	Write Inhibit Voltage	1.45	1.55	V

9.2. Initial Delivery State

The device is delivered in the following status:

- (1) The main memory array is erased; all bits are set to 1 (all bytes are FFh);
- (2) The Status Register bits are all set to 0.

9.3. Absolute Maximum Ratings

Table 18: Absolute Maximum Ratings

Parameter	Value	Unit
-----------	-------	------

Ambient Operating Temperature	-40 to 85	°C
Storage Temperature	-65 to 150	°C
Applied Input / Output Voltage	-0.6 to $V_{CC}+0.4$	V
Transient Input / Output Voltage (note: overshoot)	-2.0 to $V_{CC}+2.0$	V
V_{CC}	-0.6 to +4.2	V

Maximum Positive Overshoot Waveform

Maximum Negative Overshoot Waveform

9.4. Recommended Operating Ranges

Table 19: Recommended Operating Ranges

Parameter	Symbol	Conditions	Spec		Unit
			Min	Max	
Supply Voltage	V_{CC}	FR=66MHz, fR=30MHz FR=104MHz, fR=50MHz	1.65 2.3	2.3 3.6	V
Ambient Temperature, Operating	T_A	Industrial	-40	85	°C

9.5. DC Characteristics

Table 20: DC Characteristics at $T = -40^{\circ}\text{C} \sim 85^{\circ}\text{C}$, $V_{CC} = 1.65 \sim 3.6\text{V}$

Symbol	Parameter	Test Condition	Min	Typ	Max	Unit
I_{LI}	Input Leakage Current	----	----	----	± 1.5	μA
I_{LO}	Output Leakage Current	----	----	----	± 1.5	μA
I_{CC1}	Standby Current	$CS\# = V_{CC}$, $V_{IN} = V_{CC}$ or V_{SS}	----	5	6	μA
I_{CC2}	Deep Power-Down Current	$CS\# = V_{CC}$, $V_{IN} = V_{CC}$ or V_{SS}	----	1.1	2	μA
I_{CC3}	Operating Current (Read)	CLK=0.1 V_{CC} / 0.9 V_{CC} at 120MHz, Q=Open(*1,*2,*4 I/O)	----	17.5	20	mA
		CLK=0.1 V_{CC} / 0.9 V_{CC} at 80MHz, Q=Open(*1,*2,*4 I/O)	----	13	15	mA
I_{CC4}	Operating Current (PP)	$CS\# = V_{CC}$	----	----	10	mA
I_{CC5}	Operating Current(WRSR)	$CS\# = V_{CC}$	----	----	10	mA
I_{CC6}	Operating Current (SE)	$CS\# = V_{CC}$	----	----	10	mA
I_{CC7}	Operating Current (BE)	$CS\# = V_{CC}$	----	----	10	mA

ICC8	Operating Current (CE)	CS#=V _{CC}	----	----	10	mA
V _{IL}	Input Low Voltage	----	----	----	0.3V _{CC}	V
V _{IH}	Input High Voltage	----	0.7V _{CC}	----	----	V
V _{OL}	Output Low Voltage	I _{OL} =100μA	----	----	0.2	V
V _{OH}	Output High Voltage	I _{OH} =-100μA	V _{CC} -0.2	----	----	V

9.6.AC Characteristics

Table 21: AC Characteristics at T= -40℃~85℃, V_{CC}=1.65~3.6V, C_L=30pf

Symbol	Parameter	Min	Typ	Max	Unit
F _C	Serial Clock Frequency For: Dual I/O (BBh), Dual Output (3Bh), Quad I/O (EBh), Quad Output (6Bh) (Dual I/O & Quad I/O), on 2.7V-3.6V power supply	DC.	----	120	MHz
f _{C1}	Serial Clock Frequency For: Dual I/O (BBh), Dual Output (3Bh), Quad I/O (EBh), Quad Output (6Bh) (Dual I/O & Quad I/O), on 2.3V-2.7V power supply	DC.	----	104	MHz
f _{C2}	Serial Clock Frequency For: Dual I/O (BBh), Dual Output (3Bh), Quad I/O (EBh), Quad Output (6Bh) (Dual I/O & Quad I/O), on 1.65V-2.3V power supply	DC.	----	66	MHz
f _{C3}	Serial Clock Frequency For: Fast Read (03h), on 2.7V-3.6V power supply	DC.	----	50	MHz
f _{C4}	Serial Clock Frequency For: Fast Read (03h), on 1.65V-2.7V power supply	DC.	----	30	MHz
t _{CLH}	Serial Clock High Time	4	----	----	ns
t _{CLL}	Serial Clock Low Time	4	----	----	ns
t _{CLCH}	Serial Clock Rise Time (Slew Rate)	0.1	----	----	V/ns
t _{CHCL}	Serial Clock Fall Time (Slew Rate)	0.1	----	----	V/ns
t _{SLCH}	CS# Active Setup Time relative to CLK (1.65V-2.3V VCC)	10	----	----	ns
t _{SLCH}	CS# Active Setup Time relative to CLK (2.3V-3.6V VCC)	5	----	----	ns
t _{CHSH}	CS# Active Hold Time relative to CLK(1.65V-2.3V VCC)	10	----	----	ns
t _{CHSH}	CS# Active Hold Time relative to CLK (2.3V-3.6V VCC)	5	----	----	ns
t _{SHCH}	CS# Not Active Setup Time relative to CLK (1.65V-2.3V VCC)	5	----	----	ns
t _{SHCH}	CS# Not Active Setup Time relative to CLK (2.3V-3.6V VCC)	5			ns
t _{CHSL}	CS# Not Active Hold Time relative to CLK (1.65V-2.3V VCC)	5			ns
t _{CHSL}	CS# Not Active Hold Time relative to CLK (2.3V-3.6V VCC)	5	----	----	ns
t _{SHSL}	CS# High Time (read/write)	16	----	----	ns
t _{SHQZ}	Output Disable Time	----	----	7.5	ns
t _{CLQX}	Output Hold Time	1.65	----	----	ns
t _{DVCH}	Data In Setup Time relative to CLK (1.65V-2.3V VCC)	3			ns
t _{DVCH}	Data In Setup Time relative to CLK (2.3V-3.6V VCC)	2	----	----	ns
t _{CHDX}	Data In Hold Time relative to CLK (1.65V-2.3V VCC)	3			ns
t _{CHDX}	Data In Hold Time relative to CLK (2.3V-3.6V VCC)	2	----	----	ns

t _{HLCH}	HOLD# Low Setup Time (relative to Clock)	5	----	----	ns
t _{HHCH}	HOLD# High Setup Time (relative to Clock)	5	----	----	ns
t _{CHHL}	HOLD# High Hold Time (relative to Clock)	5	----	----	ns
t _{CHHH}	HOLD# Low Hold Time (relative to Clock)	5	----	----	ns
t _{HLQZ}	HOLD# Low To High-Z Output	----	----	6	ns
t _{HHQX}	HOLD# High To Low-Z Output	----	----	6	ns
t _{CLQV}	Clock Low To Output Valid	----	----	7	ns
t _{WHSL}	Write Protect Setup Time Before CS# Low	20	----	----	ns
t _{SHWL}	Write Protect Hold Time After CS# High	100	----	----	ns
t _{DP}	CS# High To Deep Power-Down Mode	----	----	17	μs
t _{RES1}	CS# High To Standby Mode Without Electronic Signature Read(1.65V-2.3V VCC)	----	----	31	μs
t _{RES1}	CS# High To Standby Mode Without Electronic Signature Read(2.3V-3.6V VCC)	----	----	25	μs
t _{RES2}	CS# High To Standby Mode With Electronic Signature Read(1.65V-2.3V VCC)	----	----	31	μs
t _{RES2}	CS# High To Standby Mode With Electronic Signature Read(2.3V-3.6V VCC)	----	----	25	μs
t _{SUS}	CS# High To Next Command After Suspend	----	----	38	μs
t _{RST_R}	CS# High To Next Command After Reset (from read)	----	----	50	μs
t _{RST_P}	CS# High To Next Command After Reset (from program)	----	----	72	μs
t _{RST_E}	CS# High To Next Command After Reset (from erase)	----	----	52	ms
t _W	Write Status Register Cycle Time	----	2.2	3.8	ms
t _{BP1}	Byte Program Time (First Byte)	----	101	356	us
t _{BP2}	Additional Byte Program Time (After First Byte)	----	3.9	5.5	us
t _{PP}	Page Programming Time	----	0.7	3.5	ms
t _{SE}	Sector Erase Time(1K/4K Bytes)	----	6	6.9	ms
t _{BE1}	Block Erase Time(32K Bytes)	----	6	6.9	ms
t _{BE2}	Block Erase Time(64K Bytes)	----	6	6.9	ms
t _{CE}	Chip Erase Time(NM25WQ32A)	----	7	9.2	ms

Notes:

1. Clock high + Clock low must be less than or equal to 1/fc..
2. Value guaranteed by design and/or characterization, not 100% tested in production..
3. Only applicable as a constraint for a Write Status Register instruction when Sector Protect Bit is set to 1.

Notes:

- Package length and width do not include mold flash.
- The exposed metal pad on the bottom of the package is connected to device ground (GND pin), so that it can either connect to GND or be left floating.

12. Important Notice

This document is the property of SEMIPORT and its subsidiaries (the "Company"). This document, including any product of the Company described in this document (the "Product"), is owned by the Company under the intellectual property laws and treaties of the People's Republic of China and other jurisdictions worldwide. The Company reserves all rights under such laws and treaties and does not grant any license under its patents, copyrights, trademarks, or other intellectual property rights. The names and brands of third party referred thereto (if any) are the property of their respective owner and referred to for identification purposes only.

The Company makes no warranty of any kind, express or implied, with regard to this document or any Product, including, but not limited to, the implied warranties of merchantability and fitness for a particular purpose. The Company does not assume any liability arising out of the application or use of any Product described in this document. Any information provided in this document is provided only for reference purposes. It is the responsibility of the user of this document to properly design, program, and test the functionality and safety of any application made of this information and any resulting product. Except for customized products which have been expressly identified in the applicable agreement, the Products are designed, developed, and/or manufactured for ordinary business, industrial, personal, and/or household applications only. The Products are not designed, intended, or authorized for use as components in systems designed or intended for the operation of weapons, weapons systems, nuclear installations, atomic energy control instruments, combustion control instruments, airplane or spaceship instruments, traffic signal instruments, life-support devices or systems, other medical devices or systems (including resuscitation equipment and surgical implants), pollution control or hazardous substances management, or other uses where the failure of the device or Product could cause personal injury, death, property or environmental damage ("Unintended Uses"). Customers shall take any and all actions to ensure using and selling the Products in accordance with the applicable laws and regulations. The Company is not liable, in whole or in part, and customers shall and hereby do release the Company as well as its suppliers and/or distributors from any claim, damage, or other liability arising from or related to all Unintended Uses of the Products. Customers shall indemnify and hold the Company as well as its suppliers and/or distributors harmless from and against all claims, costs, damages, and other liabilities, including claims for personal injury or death, arising from or related to any Unintended Uses of the Products. Customers shall discard the device according to the local environmental law.

Information in this document is provided solely in connection with the Products. The Company reserves the right to make changes, corrections, modifications or improvements to this document and the Products and services described herein at any time, without notice.
